**Births** 104
- Prenatal Care 105
- Birth Outcomes & Risks 106
Low-Weight Births 106
Infant Mortality 106
Key Informant Input: Infant & Child Health 107

**Family Planning** 109
Births to Adolescent Mothers 109
Key Informant Input: Family Planning 110

**Modifiable Health Risks** 111

**Nutrition** 112
Daily Recommendation of Fruits/Vegetables 113

**Physical Activity** 114
Leisure-Time Physical Activity 115
Activity Levels 115
Access to Physical Activity 118

**Weight Status** 119
Adult Weight Status 119
Key Informant Input: Nutrition, Physical Activity & Weight 122

**Substance Abuse** 124
Alcohol Use 125
Illicit Drug Use 126
Alcohol & Drug Treatment 127
Personal Impact From Substance Abuse 127
Key Informant Input: Substance Abuse 129

**Tobacco Use** 131
Cigarette Smoking 131
Other Tobacco Use 134
Key Informant Input: Tobacco Use 135

**Sexual Health** 137
HIV 137
Sexually Transmitted Diseases 139

**Access to Health Services** 142

**Health Insurance Coverage** 143
Type of Healthcare Coverage 143
Lack of Health Insurance Coverage 143

**Difficulties Accessing Healthcare** 145
Difficulties Accessing Services 145
Barriers to Healthcare Access 146
Accessing Healthcare for Children 146
Key Informant Input: Access to Healthcare Services 147

**Primary Care Services** 149

Introduction
Project Overview

Project Goals
This Community Health Needs Assessment is a systematic, data-driven approach to determining the health status, behaviors, and needs of residents in Seward County, Kansas, the service area of Southwest Medical Center. Subsequently, this information may be used to inform decisions and guide efforts to improve community health and wellness.

A Community Health Needs Assessment provides information so that communities may identify issues of greatest concern and decide to commit resources to those areas, thereby making the greatest possible impact on community health status. This Community Health Needs Assessment will serve as a tool toward reaching three basic goals:

- **To improve residents’ health status, increase their life spans, and elevate their overall quality of life.** A healthy community is not only one where its residents suffer little from physical and mental illness, but also one where its residents enjoy a high quality of life.

- **To reduce the health disparities among residents.** By gathering demographic information along with health status and behavior data, it will be possible to identify population segments that are most at-risk for various diseases and injuries. Intervention plans aimed at targeting these individuals may then be developed to combat some of the socio-economic factors that historically have had a negative impact on residents’ health.

- **To increase accessibility to preventive services for all community residents.** More accessible preventive services will prove beneficial in accomplishing the first goal (improving health status, increasing life spans, and elevating the quality of life), as well as lowering the costs associated with caring for late-stage diseases resulting from a lack of preventive care.

This assessment was conducted on behalf of Southwest Medical Center by PRC, Inc. PRC is a nationally recognized healthcare consulting firm with extensive experience conducting Community Health Needs Assessments in hundreds of communities across the United States since 1994.
**Methodology**

This assessment incorporates data from both quantitative and qualitative sources. Quantitative data input includes primary research (the PRC Community Health Survey) and secondary research (vital statistics and other existing health-related data); these quantitative components allow for trending and comparison to benchmark data at the state and national levels. Qualitative data input includes primary research gathered through an Online Key Informant Survey.

**PRC Community Health Survey**

*Survey Instrument*

The survey instrument used for this study is based largely on the Centers for Disease Control and Prevention (CDC) Behavioral Risk Factor Surveillance System (BRFSS), as well as various other public health surveys and customized questions addressing gaps in indicator data relative to health promotion and disease prevention objectives and other recognized health issues. The final survey instrument was developed by Southwest Medical Center and PRC.

*Community Defined for This Assessment*

The study area for the survey effort is defined as Seward County, Kansas. This community is the primary source of patients of Southwest Medical Center and is inclusive of medically underserved, low income, and minority populations. This community definition is illustrated in the following map.
Sample Approach & Design

A precise and carefully executed methodology is critical in asserting the validity of the results gathered in the PRC Community Health Survey. Thus, to ensure the best representation of the population surveyed, a telephone interview methodology — one that incorporates both landline and cell phone interviews — was employed. The primary advantages of telephone interviewing are timeliness, efficiency, and random-selection capabilities.

The sample design used for this effort consisted of a random sample of 200 individuals age 18 and older in Seward County. All administration of the surveys, data collection, and data analysis was conducted by PRC.

For statistical purposes, the maximum rate of error associated with a sample size of 200 respondents is ±6.9% at the 95 percent confidence level.

Expected Error Ranges for a Sample of 200 Respondents at the 95 Percent Level of Confidence

Note:
- The "response rate" (the percentage of a population giving a particular response) determines the error rate associated with that response. A "95 percent level of confidence" indicates that responses would fall within the expected error range on 95 out of 100 trials.

Examples:
- If 10% of the sample of 200 respondents answered a certain question with a "yes," it can be asserted that between 5.8% and 14.2% (10% ± 4.2%) of the total population would offer this response.
- If 50% of respondents said "yes," one could be certain with a 95 percent level of confidence that between 43.1% and 56.9% (50% ± 6.9%) of the total population would respond "yes" if asked this question.

Sample Characteristics

To accurately represent the population studied, PRC strives to minimize bias through application of a proven telephone methodology and random-selection techniques. While this random sampling of the population produces a highly representative sample, it is a common and preferred practice to "weight" the raw data to improve this representativeness even further. This is accomplished by adjusting the results of a random sample to match the geographic distribution and demographic characteristics of the population surveyed (poststratification), so as to eliminate any naturally occurring bias. Specifically, once the raw data are gathered, respondents are examined by key demographic characteristics (namely sex, age, race, ethnicity, and poverty status), and a statistical application package applies
weighting variables that produce a sample which more closely matches the population for these characteristics. Thus, while the integrity of each individual’s responses is maintained, one respondent’s responses may contribute to the whole the same weight as, for example, 1.1 respondents. Another respondent, whose demographic characteristics may have been slightly oversampled, may contribute the same weight as 0.9 respondents.

The following chart outlines the characteristics of the Seward County sample for key demographic variables, compared to actual population characteristics revealed in census data. [Note that the sample consisted solely of area residents age 18 and older; data on children were given by proxy by the person most responsible for that child’s healthcare needs, and these children are not represented demographically in this chart.]

Further note that the poverty descriptions and segmentation used in this report are based on administrative poverty thresholds determined by the US Department of Health & Human Services. These guidelines define poverty status by household income level and number of persons in the household (e.g., the 2019 guidelines place the poverty threshold for a family of four at $25,750 annual household income or lower). In sample segmentation: "low income" refers to community members living in a household with defined poverty status or living just above the poverty level, earning up to twice (<200% of) the poverty threshold; “mid/high income” refers to those households living on incomes which are twice or more (≥200% of) the federal poverty level.

The sample design and the quality control procedures used in the data collection ensure that the sample is representative. Thus, the findings may be generalized to the total population of community members in the defined area with a high degree of confidence.
Online Key Informant Survey

To solicit input from key informants, those individuals who have a broad interest in the health of the community, an Online Key Informant Survey also was implemented as part of this process. A list of recommended participants was provided by Southwest Medical Center; this list included names and contact information for physicians, public health representatives, other health professionals, social service providers, and a variety of other community leaders. Potential participants were chosen because of their ability to identify primary concerns of the populations with whom they work, as well as of the community overall.

Key informants were contacted by email, introducing the purpose of the survey and providing a link to take the survey online; reminder emails were sent as needed to increase participation. In all, 46 community stakeholders took part in the Online Key Informant Survey, as outlined below:

<table>
<thead>
<tr>
<th>Online Key Informant Survey Participation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key Informant Type</strong></td>
</tr>
<tr>
<td>Physicians</td>
</tr>
<tr>
<td>Public Health Representatives</td>
</tr>
<tr>
<td>Other Health Providers</td>
</tr>
<tr>
<td>Social Services Providers</td>
</tr>
<tr>
<td>Other Community Leaders</td>
</tr>
</tbody>
</table>

Final participation included representatives of the organizations outlined below.

- Adolescent Support Services
- Birthline Inc.
- Cimarron Valley Veterans and First Responders Service
- City of Liberal Fire Department
- First United Methodist Church
- Friends Church of Liberal
- Kansas Medical Society
- K-State Research and Extension: Wild West District
- Liberal Area Coalition for Families
- Liberal Area Rape Crisis & Domestic Violence Services
- Liberal USD 480
- Seward County Community College
- Seward County Emergency Medical Service
- Seward County Government
- Seward County Health Department
- Seward County WIC
- Sharp McQueen, P.A.
- Southern Office Supply, Inc.
- Southwest Medical Center
- St. Anthony of Padua Catholic Church
- State of Kansas
- Stepping Stone Shelter for Women, Inc.
- Wheatridge Park Care Center
- Women’s Specialty Center of Liberal
Through this process, input was gathered from several individuals whose organizations work with low-income, minority, or other medically underserved populations.

In the online survey, key informants were asked to rate the degree to which various health issues are a problem in their own community. Follow-up questions asked them to describe why they identify problem areas as such and how these might better be addressed. Results of their ratings, as well as their verbatim comments, are included throughout this report as they relate to the various other data presented.

NOTE: These findings represent qualitative rather than quantitative data. The Online Key Informant Survey was designed to gather input regarding participants’ opinions and perceptions of the health needs of the residents in the area. Thus, these findings are not necessarily based on fact.

Public Health, Vital Statistics & Other Data
A variety of existing (secondary) data sources was consulted to complement the research quality of this Community Health Needs Assessment. Data for Seward County were obtained from the following sources (specific citations are included with the graphs throughout this report):

- Center for Applied Research and Engagement Systems (CARES) Engagement Network, University of Missouri Extension
- Centers for Disease Control & Prevention, Office of Infectious Disease, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention
- Centers for Disease Control & Prevention, Office of Public Health Science Services, Center for Surveillance, Epidemiology and Laboratory Services, Division of Health Informatics and Surveillance (DHIS)
- Centers for Disease Control & Prevention, Office of Public Health Science Services, National Center for Health Statistics
- ESRI ArcGIS Map Gallery
- Kansas Department of Health and Environment
- National Cancer Institute, State Cancer Profiles
- OpenStreetMap (OSM)
- US Census Bureau, American Community Survey
- US Census Bureau, County Business Patterns
- US Census Bureau, Decennial Census
- US Department of Agriculture, Economic Research Service
- US Department of Health & Human Services
- US Department of Health & Human Services, Health Resources and Services Administration (HRSA)
- US Department of Justice, Federal Bureau of Investigation
- US Department of Labor, Bureau of Labor Statistics
Benchmark Data

Kansas Risk Factor Data
Statewide risk factor data are provided where available as an additional benchmark against which to compare local survey findings; these data represent the most recent BRFSS (Behavioral Risk Factor Surveillance System) Prevalence and Trends Data published online by the Centers for Disease Control and Prevention. State-level vital statistics are also provided for comparison of secondary data indicators.

Nationwide Risk Factor Data
Nationwide risk factor data, which are also provided in comparison charts, are taken from the 2017 PRC National Health Survey; the methodological approach for the national study is similar to that employed in this assessment, and these data may be generalized to the US population with a high degree of confidence. National-level vital statistics are also provided for comparison of secondary data indicators.

Healthy People 2020
Healthy People provides science-based, 10-year national objectives for improving the health of all Americans. For three decades, Healthy People has established benchmarks and monitored progress over time in order to:

- Encourage collaborations across communities and sectors.
- Empower individuals toward making informed health decisions.
- Measure the impact of prevention activities.

Healthy People strives to:

- Identify nationwide health improvement priorities.
- Increase public awareness and understanding of the determinants of health, disease, and disability and the opportunities for progress.
- Provide measurable objectives and goals that are applicable at the national, State, and local levels.
- Engage multiple sectors to take actions to strengthen policies and improve practices that are driven by the best available evidence and knowledge.
- Identify critical research, evaluation, and data collection needs.

Determining Significance
Differences noted in this report represent those determined to be significant. For survey-derived indicators (which are subject to sampling error), statistical significance is determined based on confidence intervals (at the 95 percent confidence level), using question-specific samples and response rates. For the purpose of this report, “significance” of secondary data
indicators (which do not carry sampling error but might be subject to reporting error) is determined by a 15% variation from the comparative measure.

**Information Gaps**

While this assessment is quite comprehensive, it cannot measure all possible aspects of health in the community, nor can it adequately represent all possible populations of interest. It must be recognized that these information gaps might in some ways limit the ability to assess all of the community’s health needs.

For example, certain population groups — such as the homeless, institutionalized persons, or those who only speak a language other than English or Spanish — are not represented in the survey data. Other population groups — for example, pregnant women, lesbian/gay/bisexual/transgender residents, undocumented residents, and members of certain racial/ethnic or immigrant groups — might not be identifiable or might not be represented in numbers sufficient for independent analyses.

In terms of content, this assessment was designed to provide a comprehensive and broad picture of the health of the overall community. However, there are certainly medical conditions that are not specifically addressed.

**Public Comment**

Southwest Medical Center made its prior Community Health Needs Assessment (CHNA) report publicly available through its website; through that mechanism, the hospital requested from the public written comments and feedback regarding the CHNA and implementation strategy. At the time of this writing, Southwest Medical Center had not received any written comments. However, through population surveys and key informant feedback for this assessment, input from the broader community was considered and taken into account when identifying and prioritizing the significant health needs of the community. Southwest Medical Center will continue to use its website as a tool to solicit public comments and ensure that these comments are considered in the development of future CHNAs.
**IRS Form 990, Schedule H Compliance**

For non-profit hospitals, a Community Health Needs Assessment (CHNA) also serves to satisfy certain requirements of tax reporting, pursuant to provisions of the Patient Protection & Affordable Care Act of 2010. To understand which elements of this report relate to those requested as part of hospitals’ reporting on IRS Schedule H (Form 990), the following table cross-references related sections.

Summary of Findings

Significant Health Needs of the Community
The following “Areas of Opportunity” represent the significant health needs of the community, based on the information gathered through this Community Health Needs Assessment. From these data, opportunities for health improvement exist in the area with regard to the following health issues (see also the summary tables presented in the following section).

The Areas of Opportunity were determined after consideration of various criteria, including: standing in comparison with benchmark data (particularly national data); identified trends; the preponderance of significant findings within topic areas; the magnitude of the issue in terms of the number of persons affected; and the potential health impact of a given issue. These also take into account those issues of greatest concern to the community stakeholders (key informants) giving input to this process.

### Areas of Opportunity Identified Through This Assessment

<table>
<thead>
<tr>
<th>Area</th>
<th>Issues</th>
</tr>
</thead>
</table>
| Access to Healthcare Services | - Lack of Health Insurance  
  - Barriers to Access (Esp. Language/Cultural Barriers)  
  - Primary Care Physician Ratio |
| Cancer                        | - Leading Cause of Death  
  - Colorectal Cancer Screening [Age 50-75] |
| Diabetes                      | - Diabetes Prevalence  
  - Diabetes Deaths  
  - Kidney Disease Deaths  
  - Key Informants: Diabetes ranked as a top concern. |
| Heart Disease & Stroke        | - Leading Cause of Death  
  - Key Informants: Heart disease and stroke ranked as a top concern. |
| Injury & Violence             | - Unintentional Injury Deaths  
  - Including Motor Vehicle Crash |
| Mental Health                 | - Mental Health Provider Ratio  
  - Have Ever Sought Help for Mental Health  
  - Key Informants: Mental health ranked as a top concern. |
| Nutrition, Physical Activity & Weight | - Fruit/Vegetable Consumption  
  - Food Insecurity  
  - Overweight & Obesity [Adults]  
  - Trying to Lose Weight [Overweight Adults]  
  - Access to Recreation/Fitness Facilities  
  - Key Informants: Nutrition, physical activity, and weight ranked as a top concern. |
| Oral Health                   | - Regular Dental Care |
| Sexual Health                 | - Teen Births  
  - Chlamydia Incidence |
| Substance Abuse               | - Binge Drinking  
  - Key Informants: Substance abuse ranked as a top concern. |
Community Feedback on Prioritization of Health Needs

Prioritization of the health needs identified in this assessment (see “Areas of Opportunity” above) was determined based on a prioritization exercise conducted among community stakeholders (representing a cross-section of community-based agencies and organizations) in conjunction with the administration of the Online Key Informant Survey.

In this process, these key informants were asked to rate the severity of a variety of health issues in the community. Insofar as these health issues were identified through the data above and/or were identified as top concerns among key informants, their ranking of these issues informed the following priorities:

1. Substance Abuse
2. Mental Health
3. Diabetes
4. Nutrition, Physical Activity & Weight
5. Heart Disease & Stroke
6. Oral Health
7. Cancer
8. Access to Healthcare Services
9. Injury & Violence
10. Sexual Health

Hospital Implementation Strategy

Southwest Medical Center will use the information from this Community Health Needs Assessment to develop an Implementation Strategy to address the significant health needs in the community. While the hospital will likely not implement strategies for all of the health issues listed above, the results of this prioritization exercise will be used to inform the development of the hospital’s action plan to guide community health improvement efforts in the coming years.

*Note: An evaluation of the hospital’s past activities to address the needs identified in prior CHNAs can be found as an appendix to this report.*
Summary Tables: Comparisons With Benchmark Data

The following tables provide an overview of indicators in Seward County, grouped by health topic.

Reading the Summary Tables

In the following tables, Seward County results are shown in the larger, blue column. Tip: Indicator labels beginning with a “%” symbol are taken from the PRC Community Health Survey; the remaining indicators are taken from secondary data sources.

The columns to the right of the Seward County column provide comparisons between local data and any available state and national findings, and Healthy People 2020 objectives. Symbols indicate whether Seward County compares favorably (○), unfavorably (●), or comparably (≈) to these external data.

Note that blank table cells signify that data are not available or are not reliable for that area and/or for that indicator.

Summary of Key Informant Perceptions

In the Online Key Informant Survey, community stakeholders were asked to rate the degree to which each of 20 health issues is a problem in their own community, using a scale of “major problem,” “moderate problem,” “minor problem,” or “no problem at all.” The following chart summarizes their responses; these findings also are outlined throughout this report, along with the qualitative input describing reasons for their concerns. (Note that these ratings alone do not establish priorities for this assessment; rather, they are one of several data inputs considered for the prioritization process described earlier.)
Community Description
Population Characteristics

Total Population
Seward County, the focus of this Community Health Needs Assessment, encompasses 639.33 square miles and houses a total population of 22,948 residents, according to latest census estimates.

- US Census Bureau American Community Survey 5-year estimates.  

Population Change 2000-2010
A significant positive or negative shift in total population over time impacts healthcare providers and the utilization of community resources.

Between the 2000 and 2010 US Censuses, the population of Seward County increased by 442 persons, or 2.0%.

- **BENCHMARK**: Growth in Seward County is lower than found across the state and nation.
Change in Total Population
(Percentage Change Between 2000 and 2010)

An increase of 442 persons

Sources: US Census Bureau Decennial Census (2000-2010).

Notes:
A significant positive or negative shift in total population over time impacts healthcare providers and the utilization of community resources.

This map shows an increase in population between 2000 and 2010 in Liberal, but decreases in other parts of the county.
## Urban/Rural Population

Urban areas are identified using population density, count, and size thresholds. Urban areas also include territory with a high degree of impervious surface (development). Rural areas are all areas that are not urban.

**Seward County is predominantly urban, with 88.6% of the population living in areas designated as urban.**

- **BENCHMARK:** The county is more urban than found across Kansas and the US.

### Urban and Rural Population (2010)

<table>
<thead>

<td>25.8%</td>
</tr>
<tr>
<td>US</td>
<td>80.9%</td>
<td>19.1%</td>
</tr>
</tbody>
</table>

**Sources:**
- US Census Bureau Decennial Census.

**Notes:**
- This indicator reports the percentage of population living in urban and rural areas. Urban areas are identified using population density, count, and size thresholds. Urban areas also include territory with a high degree of impervious surface (development). Rural areas are all areas that are not urban.

Note the following map, outlining the urban population in Seward County census tracts as of 2010.
Age

It is important to understand the age distribution of the population, as different age groups have unique health needs that should be considered separately from others along the age spectrum.

In Seward County, 31.4% of the population are children age 0-17; another 59.1% are age 18 to 64, while 9.5% are age 65 and older.

- **BENCHMARK:** Compared to the state and US, Seward County has a higher proportion of children and a lower proportion of seniors.
Median Age
Seward County is considerably “younger” than the state and the nation in that the median age is lower.

Race & Ethnicity

Race
In looking at race independent of ethnicity (Hispanic or Latino origin), 60.4% of residents of Seward County are non-Hispanic White, 4.7% are Black, and 3.0% are Asian.

- **BENCHMARK**: Seward County is more racially diverse than the state and nation.
Ethnicity

A majority (59.6%) of Seward County residents are Hispanic or Latino.

- **BENCHMARK**: The proportion of Hispanic residents in the county is much higher than found across Kansas and the US.

Hispanic Population

The Hispanic population increased by 3,504 persons, or 36.9%, between 2000 and 2010.

Notes:

- Origin can be viewed as the heritage, nationality group, lineage, or country of birth of the person or the person’s parents or ancestors before their arrival in the United States. People who identify their origin as Hispanic, Latino, or Spanish may be of any race.

Sources:

- US Census Bureau American Community Survey 5-year estimates.
Linguistic Isolation

A total of 15.7% of the Seward County population age 5 and older live in a home in which no person age 14 or older is proficient in English (speaking only English or speaking English “very well”).

- **BENCHMARK**: Significantly higher than state and national proportions.

---

**Linguistically Isolated Population**

**(2013-2017)**

Notes: This indicator reports the percentage of the population age 5+ who live in a home in which no person age 14+ speaks only English, or in which no person age 14+ speak a non-English language and speak English “very well.”
Social Determinants of Health

About Social Determinants

Health starts in our homes, schools, workplaces, neighborhoods, and communities. We know that taking care of ourselves by eating well and staying active, not smoking, getting the recommended immunizations and screening tests, and seeing a doctor when we are sick all influence our health. Our health is also determined in part by access to social and economic opportunities; the resources and supports available in our homes, neighborhoods, and communities; the quality of our schooling; the safety of our workplaces; the cleanliness of our water, food, and air; and the nature of our social interactions and relationships. The conditions in which we live explain in part why some Americans are healthier than others and why Americans more generally are not as healthy as they could be.

— Healthy People 2020 (www.healthypeople.gov)

Poverty

The latest census estimate shows 18.8% of the Seward County total population living below the federal poverty level.

- **BENCHMARK**: Worse than statewide and national findings.

Among just children (ages 0 to 17), this percentage in Seward County is 27.2% (representing almost 2,000 children).

- **BENCHMARK**: Worse than statewide and national findings.

Population in Poverty

(Populations Living Below the Poverty Level; 2013-2017)

The following maps highlight concentrations of persons living below the federal poverty level.

Sources:
- US Census Bureau American Community Survey 5-year estimates.

Notes:
- Poverty is considered a key driver of health status. This indicator is relevant because poverty creates barriers to access including health services, healthy food, and other necessities that contribute to poor health status.

Education

Among the Seward County population age 25 and older, an estimated 32.8% (over 4,300 people) do not have a high school education.

- **BENCHMARK**: Much higher than found across Kansas and the US.

**Population With No High School Diploma**

Sources: 
- US Census Bureau American Community Survey 5-year estimates.

Notes: 
- This indicator is relevant because educational attainment is linked to positive health outcomes.
Employment
According to data derived from the US Department of Labor, the unemployment rate in Seward County as of 2017 was 3.5%.

- **BENCHMARK**: Significantly better than the US unemployment rate.

Unemployment Rate
(Percent of Non-Institutionalized Population Age 16+ Unemployed, Not Seasonally-Adjusted)

Sources:

Notes:
- This indicator is relevant because unemployment creates financial instability and barriers to access including insurance coverage, health services, healthy food, and other necessities that contribute to poor health status.

Housing Insecurity
Most surveyed adults rarely, if ever, worry about the cost of housing.

Frequency of Worry or Stress
Over Paying Rent/Mortgage in the Past Year
(Seward County, 2019)

Sources:
- 2019 PRC Community Health Survey, PRC, Inc. [Item 71]

Notes:
- Asked of all respondents.
However, a considerable share (33.7%) report that they were “sometimes,” “usually,” or “always” worried or stressed about having enough money to pay their rent or mortgage in the past year.

- **DISPARITY:** Women, adults younger than 60, those with lower incomes and Hispanic residents are more likely to worry about housing costs.

**“Always/Usually/Sometimes” Worried About Paying Rent/Mortgage in the Past Year**

(Seward County, 2019)

Low food access is defined as living more than ½ mile from the nearest supermarket, supercenter, or large grocery store.

**Food Access**

**Low Food Access**

US Department of Agriculture data show that 7.4% of the Seward County population (representing almost 1,700 residents) have low food access, meaning that they do not live near a supermarket or large grocery store.

- **BENCHMARK:** More favorable than found statewide and nationally.
Population With Low Food Access
(Percent of Population That Is Far From a Supermarket or Large Grocery Store, 2015)

Sources:

Notes:
- This indicator reports the percentage of the population with low food access. Low food access is defined as living more than ½ mile from the nearest supermarket, supercenter, or large grocery store. This indicator is relevant because it highlights populations and geographies facing food insecurity.

Map Legend:
- Population with Limited Food Access, Percent by Tract, FARA

- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent's household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Food Insecurity

Overall, 38.1% of community residents are determined to be “food insecure,” having run out of food in the past year and/or been worried about running out of food.

- **BENCHMARK**: Less favorable than found across the US.
- **DISPARITY**: Food insecurity is higher among: women; adults under age 60; lower-income households; and Hispanic residents.

### Food Insecurity
(Seward County, 2019)

Surveyed adults were asked:

“I worried about whether our food would run out before we got money to buy more.

“The food that we bought just did not last, and we did not have money to get more.”

Those answering “Often” or “Sometimes True” for either statement are considered to be food insecure.

Mental Health

About Mental Health & Mental Disorders

Mental health is a state of successful performance of mental function, resulting in productive activities, fulfilling relationships with other people, and the ability to adapt to change and to cope with challenges. Mental health is essential to personal well-being, family and interpersonal relationships, and the ability to contribute to community or society. Mental disorders are health conditions that are characterized by alterations in thinking, mood, and/or behavior that are associated with distress and/or impaired functioning. Mental disorders contribute to a host of problems that may include disability, pain, or death. Mental illness is the term that refers collectively to all diagnosable mental disorders. Mental disorders are among the most common causes of disability. The resulting disease burden of mental illness is among the highest of all diseases.

Mental health and physical health are closely connected. Mental health plays a major role in people’s ability to maintain good physical health. Mental illnesses, such as depression and anxiety, affect people’s ability to participate in health-promoting behaviors. In turn, problems with physical health, such as chronic diseases, can have a serious impact on mental health and decrease a person’s ability to participate in treatment and recovery.

The existing model for understanding mental health and mental disorders emphasizes the interaction of social, environmental, and genetic factors throughout the lifespan. In behavioral health, researchers identify: risk factors, which predispose individuals to mental illness; and protective factors, which protect them from developing mental disorders. Researchers now know that the prevention of mental, emotional, and behavioral (MEB) disorders is inherently interdisciplinary and draws on a variety of different strategies. Over the past 20 years, research on the prevention of mental disorders has progressed. The major areas of progress include evidence that:

- MEB disorders are common and begin early in life.
- The greatest opportunity for prevention is among young people.
- There are multiyear effects of multiple preventive interventions on reducing substance abuse, conduct disorder, antisocial behavior, aggression, and child maltreatment.
- The incidence of depression among pregnant women and adolescents can be reduced.
- School-based violence prevention can reduce the base rate of aggressive problems in an average school by 25 to 33%.
- There are potential indicated preventive interventions for schizophrenia.
- Improving family functioning and positive parenting can have positive outcomes on mental health and can reduce poverty-related risk.
- School-based preventive interventions aimed at improving social and emotional outcomes can also improve academic outcomes.
- Interventions targeting families dealing with adversities, such as parental depression or divorce, can be effective in reducing risk for depression in children and increasing effective parenting.
- Some preventive interventions have benefits that exceed costs, with the available evidence strongest for early childhood interventions.
- Implementation is complex, and it is important that interventions be relevant to the target audiences.
- In addition to advancements in the prevention of mental disorders, there continues to be steady progress in treating mental disorders as new drugs and stronger evidence-based outcomes become available.

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Access to Care/Services
- A place to go when meds need to be regulated, and support for mental health. - Other Health Provider
- Wait times to see mental health professionals. - Community Leader
- Not knowing how to access support and having crisis support in our area. Students with significant needs are transferred to an out-of-town facility, causing more complexities for families. - Community Leader
- Total lack of mental health care! As someone that works with the youth, I see the incredible need for both childhood mental health and the negative effects that poor adult mental health care can trigger. - Community Leader
- Finding the resources to aid in mental health. - Social Services Provider
- Limitations to resources for mental health. We live in a rural community in which accessibility is not always feasible. There is also a stigma we continue to overcome as a community, especially with farmers. - Public Health Representative
- Mental health services in Liberal are not accessible. Our provider does not see patients without receiving full payments up front. - Community Leader
- Access to services. - Community Leader

Lack of Providers
- The lack of a psychiatrist who can manage the patients with issues that are too complex for a nurse practitioner to manage. - Physician
- There are no mental health doctors that handle geriatric or major issues. - Other Health Provider
- There are not enough providers to provide services for the people of this community and area. - Community Leader
- Southwest Guidance Center is a joke, and any private psychologists won’t return a phone call. - Community Leader
- Woeful lack of mental health care providers, including that SWMC does not employ a psychiatrist. - Community Leader
- Need more mental health care providers in our community. Need more providers that can provide ongoing therapy, especially to those with very low or no income. - Social Services Provider

Affordable Care/Services
- Affordable access and short-term stay beds. - Community Leader
Awareness/Education

Many people do not understand how important it is to tend to their mental health. Or, others with mental health issues do not understand that is their struggle and they do not have others around them to help them to seek assistance. - Community Leader
Death, Disease & Chronic Conditions
Leading Causes of Death

Distribution of Deaths by Cause
Together, cancers and heart disease accounted for 4 of every 10 deaths in Seward County from 2013 to 2017.

Leading Causes of Death
(Seward County, 2013-2017)

- Cancer 20.2%
- Heart Disease 20.0%
- Other 34.0%
- Alzheimer's Disease 3.0%
- Lung Disease 4.5%
- Stroke 4.5%
- Diabetes 5.4%
- Unintentional Injuries 8.7%

Sources: CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted August 2019.

Notes: Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
Lung disease is CLRD, or chronic lower respiratory disease.

Age-Adjusted Death Rates for Selected Causes

About Age-Adjusted Death Rates
In order to compare mortality in the region with other localities (in this case, Kansas and the United States), it is necessary to look at rates of death — these are figures which represent the number of deaths in relation to the population size (such as deaths per 100,000 population, as is used here).

Furthermore, in order to compare localities without undue bias toward younger or older populations, the common convention is to adjust the data to some common baseline age distribution. Use of these “age-adjusted” rates provides the most valuable means of gauging mortality against benchmark data, as well as Healthy People 2020 objectives.

The following chart outlines 2008-2017 annual average age-adjusted death rates per 100,000 population for selected causes of death in Seward County.

Each of these is discussed in greater detail in subsequent sections of this report.

For infant mortality data, see Birth Outcomes & Risks in the Births section of this report.

Cardiovascular Disease

**About Heart Disease & Stroke**

Heart disease is the leading cause of death in the United States, with stroke following as the third leading cause. Together, heart disease and stroke are among the most widespread and costly health problems facing the nation today, accounting for more than $500 billion in healthcare expenditures and related expenses in 2010 alone. Fortunately, they are also among the most preventable.

The leading modifiable (controllable) risk factors for heart disease and stroke are:

- High blood pressure
- High cholesterol
- Cigarette smoking
- Diabetes
- Poor diet and physical inactivity
- Overweight and obesity

The risk of Americans developing and dying from cardiovascular disease would be substantially reduced if major improvements were made across the US population in diet and physical activity, control of high blood pressure and cholesterol, smoking cessation, and appropriate aspirin use.

The burden of cardiovascular disease is disproportionately distributed across the population. There are significant disparities in the following based on gender, age, race/ethnicity, geographic area, and socioeconomic status:

- Prevalence of risk factors
- Access to treatment
- Appropriate and timely treatment
- Treatment outcomes
- Mortality

Disease does not occur in isolation, and cardiovascular disease is no exception. Cardiovascular health is significantly influenced by the physical, social, and political environment, including: maternal and child health; access to educational opportunities; availability of healthy foods, physical education, and extracurricular activities in schools; opportunities for physical activity, including access to safe and walkable communities; access to healthy foods; quality of working conditions and worksite health; availability of community support and resources; and access to affordable, quality healthcare.

Cardiovascular Risk Factors

About Cardiovascular Risk

Controlling risk factors for heart disease and stroke remains a challenge. High blood pressure and cholesterol are still major contributors to the national epidemic of cardiovascular disease. High blood pressure affects approximately 1 in 3 adults in the United States, and more than half of Americans with high blood pressure do not have it under control. High sodium intake is a known risk factor for high blood pressure and heart disease, yet about 90% of American adults exceed their recommendation for sodium intake.

— Healthy People 2020 (www.healthypeople.gov)

Blood Pressure & Cholesterol

A total of 35.9% of Seward County adults have been told at some point that their blood pressure was high.

- **BENCHMARK**: Fails to satisfy the HP2020 target.

A total of 24.3% of adults have been told by a health professional that their cholesterol level was high.

- **BENCHMARK**: Better than the national prevalence but fails to satisfy the HP2020 objective.
Total Cardiovascular Risk

Individual level risk factors which put people at increased risk for cardiovascular diseases include:

- High Blood Pressure
- High Blood Cholesterol
- Tobacco Use
- Physical Inactivity
- Poor Nutrition
- Overweight/Obesity
- Diabetes

Three health-related behaviors contribute markedly to cardiovascular disease:

**Poor nutrition.** People who are overweight have a higher risk for cardiovascular disease. Almost 60% of adults are overweight or obese. To maintain a proper body weight, experts recommend a well-balanced diet which is low in fat and high in fiber, accompanied by regular exercise.

**Lack of physical activity.** People who are not physically active have twice the risk for heart disease of those who are active. More than half of adults do not achieve recommended levels of physical activity.

**Tobacco use.** Smokers have twice the risk for heart attack of nonsmokers. Nearly one-fifth of all deaths from cardiovascular disease, or about 190,000 deaths a year nationally, are smoking-related. Every day, more than 3,000 young people become daily smokers in the US.

Modifying these behaviors is critical both for preventing and for controlling cardiovascular disease. Other steps that adults who have cardiovascular disease should take to reduce their risk of death and disability include adhering to treatment for high blood pressure and cholesterol, using aspirin as appropriate, and learning the symptoms of heart attack and stroke.

---

National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention
A total of 87.9% of Seward County adults report one or more cardiovascular risk factors, such as being overweight, smoking cigarettes, being physically inactive, or having high blood pressure or cholesterol.

- **DISPARITY**: Higher among adults age 60+ and non-Hispanic White residents.

### Present One or More Cardiovascular Risks or Behaviors

(Seward County, 2019)

![Bar chart showing percentage of adults with cardiovascular risks by demographic groups.]

**Key Informant Input: Heart Disease & Stroke**

The greatest share of key informants taking part in an online survey characterized *Heart Disease & Stroke* as a “moderate problem” in the community.

### Perceptions of Heart Disease and Stroke as a Problem in the Community

(Key Informants, 2019)

![Bar chart showing perceptions of heart disease and stroke as a problem.]

**Top Concerns**

Among those rating this issue as a “major problem,” reasons related to the following:
Access to Care/Services
- Access to specialized treatment. - Community Leader
  They can't get the treatment they require at the SWMC; they always end up going to Wichita. - Social Services Provider
  There are too many people in our community who are flown out because we have no heart doctors or facility. - Community Leader

Leading Cause of Death
- Because heart disease and stroke are the number one causes of death in our community, as they are in the rest of the country. - Community Leader

Contributing Factors
- Many residents do not seek proper medical assistance or understand the importance of heart health and taking preventative measures to reduce heart disease and chances of having a stroke. - Community Leader
  Doctors are four hours away. - Other Health Provider

Prevalence/Incidence
- Large percentage of people experiencing this type of problem. - Community Leader
Cancer

About Cancer

Continued advances in cancer research, detection, and treatment have resulted in a decline in both incidence and death rates for all cancers. Among people who develop cancer, more than half will be alive in five years. Yet, cancer remains a leading cause of death in the United States, second only to heart disease.

Many cancers are preventable by reducing risk factors such as: use of tobacco products; physical inactivity and poor nutrition; obesity; and ultraviolet light exposure. Other cancers can be prevented by getting vaccinated against human papillomavirus and hepatitis B virus. In the past decade, overweight and obesity have emerged as new risk factors for developing certain cancers, including colorectal, breast, uterine corpus (endometrial), and kidney cancers. The impact of the current weight trends on cancer incidence will not be fully known for several decades. Continued focus on preventing weight gain will lead to lower rates of cancer and many chronic diseases.

Screening is effective in identifying some types of cancers (see US Preventive Services Task Force [USPSTF] recommendations), including:

- Breast cancer (using mammography)
- Cervical cancer (using Pap tests)
- Colorectal cancer (using fecal occult blood testing, sigmoidoscopy, or colonoscopy)

--- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Cancer Deaths

Between 2015 and 2017, there was an annual average age-adjusted cancer mortality rate of 133.1 deaths per 100,000 population in Seward County.

- **BENCHMARK**: Better than the Kansas and US rates.

Cancer: Age-Adjusted Mortality

(2015-2017 Annual Average Deaths per 100,000 Population)

Healthy People 2020 = 161.4 or Lower

- 2017 PRC National Health Survey, PRC, Inc.

Notes:
- Asked of all respondents.
Cancer Risk

About Cancer Risk

Reducing the nation’s cancer burden requires reducing the prevalence of behavioral and environmental factors that increase cancer risk.

- All cancers caused by cigarette smoking could be prevented. At least one-third of cancer deaths that occur in the United States are due to cigarette smoking.
- According to the American Cancer Society, about one-third of cancer deaths that occur in the United States each year are due to nutrition and physical activity factors, including obesity.

— National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Cancer Screenings

The American Cancer Society recommends that both men and women get a cancer-related checkup during a regular doctor’s checkup. It should include examination for cancers of the thyroid, testicles, ovaries, lymph nodes, oral cavity, and skin, as well as health counseling about tobacco, sun exposure, diet and nutrition, risk factors, sexual practices, and environmental and occupational exposures.

Screening levels in the community were measured in the PRC Community Health Survey relative to three cancer sites: female breast cancer (mammography); cervical cancer (Pap smear testing); and colorectal cancer (sigmoidoscopy and fecal occult blood testing).

Female Breast Cancer

The US Preventive Services Task Force (USPSTF) recommends biennial screening mammography for women aged 50 to 74 years.

Cervical Cancer

The US Preventive Services Task Force (USPSTF) strongly recommends screening for cervical cancer every 3 years with cervical cytology alone in women aged 21 to 29 years.

Colorectal Cancer

The US Preventive Services Task Force (USPSTF) recommends screening for colorectal cancer starting at age 50 years and continuing until age 75 years.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

Among women age 50-74, 82.5% have had a mammogram within the past 2 years.

Among Seward County women age 21 to 65, 78.3% have had a Pap smear within the past 3 years.

- BENCHMARK: Fails to satisfy the HP2020 objective.
Among all adults age 50-75, 64.9% have had appropriate colorectal cancer screening.

- **BENCHMARK**: Less favorable than the US rate.

**Top Concerns**

Among those rating this issue as a “major problem,” reasons related to the following:
Access to Care/Services

- A member of my family was diagnosed as a child. The hospital here was not trained in the simple procedure in how to access a pediatric port. Lack of skilled providers is an enormous issue. - Social Services Provider
- I know numerous people that have to go clear to Kansas City or Wichita for help. - Social Services Provider
- Access to a full-time cancer specialist. - Community Leader
- I hear most folks go to Garden City, Dodge City, or Wichita. - Community Leader

Prevalence/Incidence

- Many types of cancer affect families and neighbors of all ages in our community. - Other Health Provider
- Several people in the area have been diagnosed. Also, we need more professionals in the area to care for our cancer patients. - Community Leader

Diagnosis/Treatment

- Many of our residents, many who do not have easy access to medical care, do not find out about their cancer until it is in later stages. - Community Leader
Respiratory Disease

About Asthma & COPD

Asthma and chronic obstructive pulmonary disease (COPD) are significant public health burdens. Specific methods of detection, intervention, and treatment exist that may reduce this burden and promote health.

Asthma is a chronic inflammatory disorder of the airways characterized by episodes of reversible breathing problems due to airway narrowing and obstruction. These episodes can range in severity from mild to life threatening. Symptoms of asthma include wheezing, coughing, chest tightness, and shortness of breath. Daily preventive treatment can prevent symptoms and attacks and enable individuals who have asthma to lead active lives.

COPD is a preventable and treatable disease characterized by airflow limitation that is not fully reversible. The airflow limitation is usually progressive and associated with an abnormal inflammatory response of the lung to noxious particles or gases (typically from exposure to cigarette smoke). Treatment can lessen symptoms and improve quality of life for those with COPD.

The burden of respiratory diseases affects individuals and their families, schools, workplaces, neighborhoods, cities, and states. Because of the cost to the healthcare system, the burden of respiratory diseases also falls on society; it is paid for with higher health insurance rates, lost productivity, and tax dollars. Annual healthcare expenditures for asthma alone are estimated at $20.7 billion.

Asthma. The prevalence of asthma has increased since 1980. However, deaths from asthma have decreased since the mid-1990s. The causes of asthma are an active area of research and involve both genetic and environmental factors.

Risk factors for asthma currently being investigated include:

- Having a parent with asthma
- Sensitization to irritants and allergens
- Respiratory infections in childhood
- Overweight

Asthma affects people of every race, sex, and age. However, significant disparities in asthma morbidity and mortality exist, in particular for low-income and minority populations. Populations with higher rates of asthma include: children; women (among adults) and boys (among children); African Americans; Puerto Ricans; people living in the Northeast United States; people living below the Federal poverty level; and employees with certain exposures in the workplace.

While there is not a cure for asthma yet, there are diagnoses and treatment guidelines that are aimed at ensuring that all people with asthma live full and active lives.

— Healthy People 2020 (www.healthypeople.gov)
Age-Adjusted Respiratory Disease Deaths

Chronic Lower Respiratory Disease Deaths (CLRD)

Between 2013 and 2017, there was an annual average age-adjusted CLRD mortality rate of 32.7 deaths per 100,000 population in Seward County.

- **BENCHMARK:** More favorable than found across Kansas and the US.

CLRD: Age-Adjusted Mortality
(2013-2017 Annual Average Deaths per 100,000 Population)

Notes: Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.

Influenza & Pneumonia Vaccination

About Influenza & Pneumonia

Acute respiratory infections, including pneumonia and influenza, are the 8th leading cause of death in the nation, accounting for 56,000 deaths annually. Pneumonia mortality in children fell by 97% in the last century, but respiratory infectious diseases continue to be leading causes of pediatric hospitalization and outpatient visits in the US. On average, influenza leads to more than 200,000 hospitalizations and 36,000 deaths each year. The 2009 H1N1 influenza pandemic caused an estimated 270,000 hospitalizations and 12,270 deaths (1,270 of which were of people younger than age 18) between April 2009 and March 2010.

— Healthy People 2020 (www.healthypeople.gov)

Among Seward County adults age 65 and older, 52.7% received a flu vaccination within the past year.

- **BENCHMARK**: Significantly lower than the national figure. Fails to satisfy the HP2020 objective.

Among Seward County adults age 65 and older, 59.8% have received a pneumonia vaccination at some point in their lives.

- **BENCHMARK**: Significantly lower than the state and US findings. Fails to satisfy the HP2020 objective.
Prevalence of Respiratory Disease

Asthma

Adults

A total of 5.6% of Seward County adults currently suffer from asthma.

- **BENCHMARK**: More favorable than found across the state and nation.
- **DISPARITY**: Higher among non-Hispanic White residents.

**Prevalence of Asthma**

Survey respondents were asked to indicate whether they suffer from or have been diagnosed with various respiratory conditions, including asthma and COPD.

The greatest share of key informants taking part in an online survey characterized Respiratory Disease as a “moderate problem” in the community.

Perceptions of Respiratory Diseases as a Problem in the Community

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:
Environmental Contributors

- Environmental lung issues from National Beef packing company and dust from prairie living. - Community Leader

Lack of Providers

- Not enough medical doctors who are specialists in this area. - Social Services Provider
Injury & Violence

About Injury & Violence

Injuries and violence are widespread in society. Both unintentional injuries and those caused by acts of violence are among the top 15 killers for Americans of all ages. Many people accept them as “accidents,” “acts of fate,” or as “part of life.” However, most events resulting in injury, disability, or death are predictable and preventable.

Injuries are the leading cause of death for Americans ages 1 to 44, and a leading cause of disability for all ages, regardless of sex, race/ethnicity, or socioeconomic status. More than 180,000 people die from injuries each year, and approximately 1 in 10 sustains a nonfatal injury serious enough to be treated in a hospital emergency department.

Beyond their immediate health consequences, injuries and violence have a significant impact on the well-being of Americans by contributing to:

- Premature death
- Disability
- Poor mental health
- High medical costs
- Lost productivity

The effects of injuries and violence extend beyond the injured person or victim of violence to family members, friends, coworkers, employers, and communities.

Numerous factors can affect the risk of unintentional injury and violence, including individual behaviors, physical environment, access to health services (ranging from pre-hospital and acute care to rehabilitation), and social environment (from parental monitoring and supervision of youth to peer group associations, neighborhoods, and communities).

Interventions addressing these social and physical factors have the potential to prevent unintentional injuries and violence. Efforts to prevent unintentional injury may focus on:

- Modifications of the environment
- Improvements in product safety
- Legislation and enforcement
- Education and behavior change
- Technology and engineering

Efforts to prevent violence may focus on:

- Changing social norms about the acceptability of violence
- Improving problem-solving skills (for example, parenting, conflict resolution, coping)
- Changing policies to address the social and economic conditions that often give rise to violence

--- Healthy People 2020 (www.healthypeople.gov)

Unintentional Injury

Age-Adjusted Unintentional Injury Deaths

Between 2015 and 2017, there was an annual average age-adjusted unintentional injury mortality rate of 60.4 deaths per 100,000 population in Seward County.

- **BENCHMARK**: Worse than state and national rates. Fails to satisfy the HP2020 objective.

- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
Falls

Each year, an estimated one-third of older adults fall, and the likelihood of falling increases substantially with advancing age. In 2005, a total of 15,802 persons age ≥65 years died as a result of injuries from falls.

Falls are the leading cause of fatal and nonfatal injuries for persons aged ≥65 years … In 2006, approximately 1.8 million persons aged ≥65 years (nearly 5% of all persons in that age group) sustained some type of recent fall-related injury. Even when those injuries are minor, they can seriously affect older adults' quality of life by inducing a fear of falling, which can lead to self-imposed activity restrictions, social isolation, and depression.

In addition, fall-related medical treatment places a burden on US healthcare services. In 2000, direct medical costs for fall-related injuries totaled approximately $19 billion. A recent study determined that 31.8% of older adults who sustained a fall-related injury required help with activities of daily living as a result, and among them, 58.5% were expected to require help for at least 6 months.

Modifiable fall risk factors include muscle weakness, gait and balance problems, poor vision, use of psychoactive medications, and home hazards. Falls among older adults can be reduced through evidence-based fall-prevention programs that address these modifiable risk factors. Most effective interventions focus on exercise, alone or as part of a multifaceted approach that includes medication management, vision correction, and home modifications.

— Division of Unintentional Injury Prevention, National Center for Injury Prevention and Control, CDC

Among surveyed Seward County adults age 45 and older, most have not fallen in the past year.

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Drugs/Alcohol
I think the issues that we have with substance abuse as well as mental health have led to problems with violence and injury. - Community Leader

Denial/Stigma
People are afraid of the person who is hurting, or they are too embarrassed to seek help. - Social Services Provider

Domestic/Child Abuse
More and more incidents of domestic violence and child abuse. - Social Services Provider

Notes:
- Asked of all respondents.

Diabetes

About Diabetes

Diabetes mellitus occurs when the body cannot produce or respond appropriately to insulin. Insulin is a hormone that the body needs to absorb and use glucose (sugar) as fuel for the body’s cells. Without a properly functioning insulin signaling system, blood glucose levels become elevated and other metabolic abnormalities occur, leading to the development of serious, disabling complications. Many forms of diabetes exist; the three common types are Type 1, Type 2, and gestational diabetes. Effective therapy can prevent or delay diabetic complications.

Diabetes mellitus:
  - Lowers life expectancy by up to 15 years.
  - Increases the risk of heart disease by 2 to 4 times.
  - Is the leading cause of kidney failure, lower limb amputations, and adult-onset blindness.

The rate of diabetes mellitus continues to increase both in the United States and throughout the world. Due to the steady rise in the number of persons with diabetes mellitus, and possibly earlier onset of type 2 diabetes mellitus, there is growing concern about the possibility that the increase in the number of persons with diabetes mellitus and the complexity of their care might overwhelm existing healthcare systems.

People from minority populations are more frequently affected by type 2 diabetes. Minority groups constitute 25% of all adult patients with diabetes in the US and represent the majority of children and adolescents with type 2 diabetes.

Lifestyle change has been proven effective in preventing or delaying the onset of type 2 diabetes in high-risk individuals.

— Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Diabetes Deaths

Between 2015 and 2017, there was an annual average age-adjusted diabetes mortality rate of 41.9 deaths per 100,000 population in Seward County.

- **BENCHMARK**: Nearly double the state and national rates. Fails to satisfy the HP2020 objective.
Diabetes: Age-Adjusted Mortality
(2015-2017 Annual Average Deaths per 100,000 Population)
Healthy People 2020 = 20.5 or Lower (Adjusted)

Prevalence of Diabetes

A total of 17.3% of Seward County adults report having been diagnosed with diabetes.

- **BENCHMARK**: Worse than the statewide prevalence.
- **DISPARITY**: More prevalent among men and lower-income adults. Increases sharply with age.

Prevalence of Diabetes

(Seward County, 2019)

Key Informant Input: Diabetes
A high percentage of key informants taking part in an online survey characterized Diabetes as a “major problem” in the community.

Perceptions of Diabetes as a Problem in the Community
(Key Informants, 2019)

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Lack of Providers

Diabetes is a very serious condition, and access to endocrinology is needed in our community. - Social Services Provider

We do not have any diabetes specialists, no doctor, no dietitian who specialize in diabetes. Therefore, individuals with diabetes flounder. And look online. - Community Leader

No endocrinologist locally. - Community Leader

No endocrinologist in town or region. Type 1 diabetics have to go to larger cities for doctors. - Community Leader
**Disease Management**
- No routine blood sugar checkup. - Physician
- Poor compliance with taking medications and following care instructions, sometimes due to communication barriers. - Physician
- The biggest challenge is availability of diabetes specialty management care. Most are referred to either Denver or Oklahoma City or Wichita to see an endocrinologist. - Community Leader

**Prevalence/Incidence**
- More and more individuals are being diagnosed with pre-diabetes and diabetes, many without health insurance and resources to get necessary medications and follow-up. - Social Services Provider
- Many community members have this condition. - Community Leader

**Affordable Care/Services**
- Cost of ongoing treatment and access to education and supplies. - Community Leader

**Awareness/Education**
- Lack of education. - Public Health Representative

**Diagnosis/Treatment**
- Many do not know that they have diabetes until much later; thus, it is not treated properly before leading to other complications. - Community Leader
Kidney Disease

About Kidney Disease

Chronic kidney disease and end-stage renal disease are significant public health problems in the United States and a major source of suffering and poor quality of life for those afflicted. They are responsible for premature death and exact a high economic price from both the private and public sectors. Nearly 25% of the Medicare budget is used to treat people with chronic kidney disease and end-stage renal disease.

Genetic determinants have a large influence on the development and progression of chronic kidney disease. It is not possible to alter a person’s biology and genetic determinants; however, environmental influences and individual behaviors also have a significant influence on the development and progression of chronic kidney disease. As a result, some populations are disproportionately affected. Successful behavior modification is expected to have a positive influence on the disease.

Diabetes is the most common cause of kidney failure. The results of the Diabetes Prevention Program (DPP) funded by the National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK) show that moderate exercise, a healthier diet, and weight reduction can prevent development of type 2 diabetes in persons at risk.

— Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Kidney Disease Deaths

Between 2013 and 2017, there was an annual average age-adjusted kidney disease mortality rate of 17.5 deaths per 100,000 population in Seward County.

- **BENCHMARK**: Less favorable than the national rate.

Kidney Disease: Age-Adjusted Mortality

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Access to Care/Services

- People are always going out of town because of lack of options. - Social Services Provider
- Only one place to do dialysis and one doctor that comes from four hours away. Must drive four hours for care. - Other Health Provider

Prevalence/Incidence

- Wife was told doctors here are overloaded with kidney cases. We went to Amarillo, Texas. - Community Leader
### Potentially Disabling Conditions

#### Multiple Chronic Conditions

Among Seward County survey respondents, most report currently having at least one chronic health condition.

#### Number of Current Chronic Conditions

(Seward County, 2019)

- None 21.8%
- One 27.0%
- Two 15.3%
- Three/More 35.9%

**Sources:** 2019 PRC Community Health Survey, PRC, Inc. [Item 143]

**Notes:**
- Asked of all respondents.
- In this case, chronic conditions include lung disease, arthritis, sciatica, cancer, osteoporosis, kidney disease, heart attack, angina, stroke, asthma, high blood pressure, high blood cholesterol, diabetes, obesity, and/or diagnosed depression.

In fact, 35.9% of Seward County adults report having three or more chronic conditions.

- **DISPARITY:** Lower-income and non-Hispanic White residents are more likely to report having multiple chronic conditions. In addition, note the correlation with age.

#### Currently Have Three or More Chronic Conditions

(Seward County, 2019)

- In this case, chronic conditions include lung disease, arthritis, sciatica, cancer, osteoporosis, kidney disease, heart attack, angina, stroke, asthma, high blood pressure, high blood cholesterol, diabetes, obesity, and/or diagnosed depression.
Activity Limitations

About Disability & Health

An individual can get a disabling impairment or chronic condition at any point in life. Compared with people without disabilities, people with disabilities are more likely to:

- Experience difficulties or delays in getting the health care they need.
- Not have had an annual dental visit.
- Not have had a mammogram in past 2 years.
- Not have had a Pap test within the past 3 years.
- Not engage in fitness activities.
- Use tobacco.
- Be overweight or obese.
- Have high blood pressure.
- Experience symptoms of psychological distress.
- Receive less social-emotional support.
- Have lower employment rates.

There are many social and physical factors that influence the health of people with disabilities. The following three areas for public health action have been identified, using the International Classification of Functioning, Disability, and Health (ICF) and the three World Health Organization (WHO) principles of action for addressing health determinants.

- **Improve the conditions of daily life** by: encouraging communities to be accessible so all can live in, move through, and interact with their environment; encouraging community living; and removing barriers in the environment using both physical universal design concepts and operational policy shifts.

- **Address the inequitable distribution of resources among people with disabilities and those without disabilities** by increasing: appropriate health care for people with disabilities; education and work opportunities; social participation; and access to needed technologies and assistive supports.

- **Expand the knowledge base and raise awareness about determinants of health for people with disabilities** by increasing: the inclusion of people with disabilities in public health data collection efforts across the lifespan; the inclusion of people with disabilities in health promotion activities; and the expansion of disability and health training opportunities for public health and health care professionals.

— Healthy People 2020 (www.healthypeople.gov)

A total of 18.3% of Seward County adults are limited in some way in some activities due to a physical, mental, or emotional problem.

- **BENCHMARK**: Better than the national finding.
- **DISPARITY**: Non-Hispanic White residents are significantly more likely to report having limitations.
Limited in Activities in Some Way
Due to a Physical, Mental or Emotional Problem

Arthritis, Osteoporosis & Chronic Back Conditions

**About Arthritis, Osteoporosis & Chronic Back Conditions**

There are more than 100 types of arthritis. Arthritis commonly occurs with other chronic conditions, such as diabetes, heart disease, and obesity. Interventions to treat the pain and reduce the functional limitations from arthritis are important, and may also enable people with these other chronic conditions to be more physically active. Arthritis affects 1 in 5 adults and continues to be the most common cause of disability. It costs more than $128 billion per year. All of the human and economic costs are projected to increase over time as the population ages. There are interventions that can reduce arthritis pain and functional limitations, but they remain underused. These include: increased physical activity; self-management education; and weight loss among overweight/obese adults.

Osteoporosis is a disease marked by reduced bone strength leading to an increased risk of fractures (broken bones). In the United States, an estimated 5.3 million people age 50 years and older have osteoporosis. Most of these people are women, but about 0.8 million are men. Just over 34 million more people, including 12 million men, have low bone mass, which puts them at increased risk for developing osteoporosis. Half of all women and as many as 1 in 4 men age 50 years and older will have an osteoporosis-related fracture in their lifetime.

Chronic back pain is common, costly, and potentially disabling. About 80% of Americans experience low back pain in their lifetime. It is estimated that each year:

- 15%-20% of the population develop protracted back pain.
- 2-8% have chronic back pain (pain that lasts more than 3 months).
- 3-4% of the population is temporarily disabled due to back pain.
- 1% of the working-age population is disabled completely and permanently as a result of low back pain.

Americans spend at least $50 billion each year on low back pain. Low back pain is the:

- 2nd leading cause of lost work time (after the common cold).
- 3rd most common reason to undergo a surgical procedure.
- 5th most frequent cause of hospitalization.

Arthritis, osteoporosis, and chronic back conditions all have major effects on quality of life, the ability to work, and basic activities of daily living.

—Healthy People 2020 (www.healthypeople.gov)

Nearly one-third of Seward County adults age 50 and older (32.3%) report suffering from arthritis or rheumatism.

A total of 3.6% of Seward County adults age 50 and older have osteoporosis.

- **BENCHMARK**: More favorable than the US finding.

A total of 16.8% of Seward County adults (18 and older) suffer from chronic back pain or sciatica.

- **BENCHMARK**: More favorable than the US finding.

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

Affordable Care/Services

- I see many patients who do not have finances for vision care or glasses. - Social Services Provider
- Not everyone has insurance, and they can't afford the eye exam and glasses. - Social Services Provider

Contributing Factors

- With a large percentage of our population being of low socioeconomic status, medical care is a strain on budgets, and hearing and vision care seems almost frivolous. - Community Leader

Alzheimer’s Disease

About Dementia

Dementia is the loss of cognitive functioning—thinking, remembering, and reasoning—to such an extent that it interferes with a person’s daily life. Dementia is not a disease itself but rather a set of symptoms. Memory loss is a common symptom of dementia, although memory loss by itself does not mean a person has dementia. Alzheimer’s disease is the most common cause of dementia, accounting for the majority of all diagnosed cases.

Alzheimer’s disease is the 6th leading cause of death among adults age 18 years and older. Estimates vary, but experts suggest that up to 5.1 million Americans age 65 years and older have Alzheimer’s disease. These numbers are predicted to more than double by 2050 unless more effective ways to treat and prevent Alzheimer’s disease are found.

--- Healthy People 2020 (www.healthypeople.gov)
Age-Adjusted Alzheimer’s Disease Deaths

Between 2008 and 2017, there was an annual average age-adjusted Alzheimer’s disease mortality rate of 19.7 deaths per 100,000 population in Seward County.

- **BENCHMARK**: Lower than found across Kansas and the nation.

### Alzheimer’s Disease: Age-Adjusted Mortality

Prenatal Care

About Infant & Child Health

Improving the well-being of mothers, infants, and children is an important public health goal for the US. Their well-being determines the health of the next generation and can help predict future public health challenges for families, communities, and the healthcare system. The risk of maternal and infant mortality and pregnancy-related complications can be reduced by increasing access to quality preconception (before pregnancy) and inter-conception (between pregnancies) care. Moreover, healthy birth outcomes and early identification and treatment of health conditions among infants can prevent death or disability and enable children to reach their full potential. Many factors can affect pregnancy and childbirth, including pre-conception health status, age, access to appropriate healthcare, and poverty.

Infant and child health are similarly influenced by socio-demographic factors, such as family income, but are also linked to the physical and mental health of parents and caregivers. There are racial and ethnic disparities in mortality and morbidity for mothers and children, particularly for African Americans. These differences are likely the result of many factors, including social determinants (such as racial and ethnic disparities in infant mortality; family income; educational attainment among household members; and health insurance coverage) and physical determinants (i.e., the health, nutrition, and behaviors of the mother during pregnancy and early childhood).

— Healthy People 2020 (www.healthypeople.gov)
Birth Outcomes & Risks

Low-Weight Births

A total of 5.7% of 2006-2012 Seward County births were low-weight.

- **BENCHMARK:** More favorable than found across Kansas and the US.

![Graph showing low-weight births in Seward County, KS, and US](image)

**Low-Weight Births**

(Percent of Live Births, 2006-2012)

Healthy People 2020 = 7.8% or Lower

Sources:

Note:
- This indicator reports the percentage of total births that are low birth weight (Under 2500g). This indicator is relevant because low birth weight infants are at high risk for health problems. This indicator can also highlight the existence of health disparities.

Infant Mortality

Between 2013 and 2017, there was an annual average of 6.5 infant deaths per 1,000 live births.
Infant Mortality Rate
(Annual Average Infant Deaths per 1,000 Live Births, 2013-2017)
Healthy People 2020 = 6.0 or Lower

Seward County KS US
0 1 2 3 4 5 6 7

Sources:

Notes:
- Infant deaths include deaths of children under 1 year old.
- This indicator is relevant because high rates of infant mortality indicate the existence of broader issues pertaining to access to care and maternal and child health.

Key Informant Input: Infant & Child Health
Key informants taking part in an online survey generally characterized Infant & Child Health as a “moderate problem” in the community.

Perceptions of Infant and Child Health as a Problem in the Community

Notes:
- Asked of all respondents.

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Lack of Providers
- We are underserved by pediatricians, doctors, and APRNs. - Community Leader
- Lack of pediatricians in Seward County. - Community Leader
- I don’t know of a good pediatrician in the area. - Community Leader

Affordable Care/Services
- Most families can’t afford it. - Social Services Provider
Many residents do not have time or have the monetary means to take part in well child checks in order to prevent serious illness in infants and children. - Community Leader

Access to Care/Services
Difficult to get health care. We need pediatricians. - Community Leader

Contributing Factors
Generational poverty leads to continual poverty. - Community Leader
We have too many teenage pregnancies and single parent families. Both of these situations invite a poor living situation for young children. - Community Leader
Family Planning
Births to Adolescent Mothers

About Adolescent Births
The negative outcomes associated with unintended pregnancies are compounded for adolescents. Teen mothers:
- Are less likely to graduate from high school or attain a GED by the time they reach age 30.
- Earn an average of approximately $3,500 less per year, when compared with those who delay childbearing.
- Receive nearly twice as much Federal aid for nearly twice as long.

Similarly, early fatherhood is associated with lower educational attainment and lower income. Children of teen parents are more likely to have lower cognitive attainment and exhibit more behavior problems. Sons of teen mothers are more likely to be incarcerated, and daughters are more likely to become adolescent mothers.

— Healthy People 2020 (www.healthypeople.gov)

Between 2006 and 2012, there were 92.3 births to adolescents age 15 to 19 per 1,000 women age 15 to 19 in Seward County.

- BENCHMARK: Dramatically higher than statewide and national rates.

Teen Birth Rate
(Births to Adolescents Age 15-19 per 1,000 Females Age 15-19, 2006-2012)

<table>
<thead>
<tr>
<th>Seward County</th>
<th>KS</th>
<th>US</th>
</tr>
</thead>
<tbody>
<tr>
<td>92.3</td>
<td>39.9</td>
<td>36.6</td>
</tr>
</tbody>
</table>

Sources: Centers for Disease Control and Prevention, National Vital Statistics System.

Notes: This indicator reports the rate of total births to women under the age of 15–19 per 1,000 female population age 15–19. This indicator is relevant because in many cases, teen parents have unique social, economic, and health support services. Additionally, high rates of teen pregnancy may indicate the prevalence of unsafe sex practices.
Key Informant Input: Family Planning

Key informants taking part in an online survey largely characterized *Family Planning* as a “moderate problem” in the community.

**Top Concerns**

Among those rating this issue as a “major problem,” reasons related to the following:

**Teen Pregnancy**

- We have one of the highest teen pregnancy rates in the state, and our school system does very little along with other organizations to introduce awareness. - Community Leader
- High rate of teen pregnancy. - Community Leader
- We have too many young-girl pregnancies and single-parent families. We must find a way to help young men understand their responsibilities regarding protected sex and family responsibilities. We must also help young women to learn how to say no to unprotected sex. - Community Leader

**Awareness/Education**

- Families do not have the educational foundations to lead healthy and positive lives. - Community Leader
- There are little to no family educational programs/planning available to community. Seward has had a high rate of unplanned teenage pregnancy rates for many years. Cultural barriers also play a factor within the Latino community, as it can be "taboo" to talk about reproductive health services, including patient education and counseling, STIs, contraceptive services, etc. - Public Health Representative

**Insurance Issues**

- Individuals who do not have insurance, either because they do not work enough hours or they are undocumented, have minimal opportunities to get family planning education and resources. - Community Leader

**Access to Care/Services**

- Not enough resources and education at the high school level. Seems to be high numbers of teen pregnancy. - Public Health Representative

**Contributing Factor**

- Again, many residents do not seek adequate medical assistance, which includes prenatal care. - Community Leader
Modifiable Health Risks
Nutrition

About Healthful Diet & Healthy Weight

Strong science exists supporting the health benefits of eating a healthful diet and maintaining a healthy body weight. Efforts to change diet and weight should address individual behaviors, as well as the policies and environments that support these behaviors in settings such as schools, worksites, healthcare organizations, and communities.

The goal of promoting healthful diets and healthy weight encompasses increasing household food security and eliminating hunger.

Americans with a healthful diet:

- Consume a variety of nutrient-dense foods within and across the food groups, especially whole grains, fruits, vegetables, low-fat or fat-free milk or milk products, and lean meats and other protein sources.
- Limit the intake of saturated and trans fats, cholesterol, added sugars, sodium (salt), and alcohol.
- Limit caloric intake to meet caloric needs.

Diet and body weight are related to health status. Good nutrition is important to the growth and development of children. A healthful diet also helps Americans reduce their risks for many health conditions, including: overweight and obesity; malnutrition; iron-deficiency anemia; heart disease; high blood pressure; dyslipidemia (poor lipid profiles); type 2 diabetes; osteoporosis; oral disease; constipation; diverticular disease; and some cancers.

Diet reflects the variety of foods and beverages consumed over time and in settings such as worksites, schools, restaurants, and the home. Interventions to support a healthier diet can help ensure that:

- Individuals have the knowledge and skills to make healthier choices.
- Healthier options are available and affordable.

Social Determinants of Diet. Demographic characteristics of those with a more healthful diet vary with the nutrient or food studied. However, most Americans need to improve some aspect of their diet.

Social factors thought to influence diet include:

- Knowledge and attitudes
- Skills
- Social support
- Societal and cultural norms
- Food and agricultural policies
- Food assistance programs
- Economic price systems

Physical Determinants of Diet. Access to and availability of healthier foods can help people follow healthful diets. For example, better access to retail venues that sell healthier options may have a positive impact on a person’s diet; these venues may be less available in low-income or rural neighborhoods.

The places where people eat appear to influence their diet. For example, foods eaten away from home often have more calories and are of lower nutritional quality than foods prepared at home.

Marketing also influences people’s—particularly children’s—food choices.

— Healthy People 2020 (www.healthypeople.gov)
Daily Recommendation of Fruits/Vegetables

A total of 20.8% of Seward County adults report eating five or more servings of fruits and/or vegetables per day.

- **BENCHMARK**: Less favorable than the national figure.
- **DISPARITY**: Adults ages 18 to 39, low-income residents and Hispanic adults are less likely to eat the recommended daily servings of fruits and vegetables.

### Consume Five or More Servings of Fruits/Vegetables Per Day

(Seward County, 2019)

To measure fruit and vegetable consumption, survey respondents were asked multiple questions, specifically about the foods and drinks they consumed on the day prior to the interview.

**Related Issue:** See also Food Access in the Social Determinants of Health section of this report.

Physical Activity

About Physical Activity

Regular physical activity can improve the health and quality of life of Americans of all ages, regardless of the presence of a chronic disease or disability. Among adults, physical activity can lower the risk of: early death; coronary heart disease; stroke; high blood pressure; type 2 diabetes; breast and colon cancer; falls; and depression. Among children and adolescents, physical activity can: improve bone health; improve cardiorespiratory and muscular fitness; decrease levels of body fat; and reduce symptoms of depression. For people who are inactive, even small increases in physical activity are associated with health benefits.

Personal, social, economic, and environmental factors all play a role in physical activity levels among youth, adults, and older adults. Understanding the barriers to and facilitators of physical activity is important to ensure the effectiveness of interventions and other actions to improve levels of physical activity.

Factors positively associated with adult physical activity include: postsecondary education; higher income; enjoyment of exercise; expectation of benefits; belief in ability to exercise (self-efficacy); history of activity in adulthood; social support from peers, family, or spouse; access to and satisfaction with facilities; enjoyable scenery; and safe neighborhoods.

Factors negatively associated with adult physical activity include: advancing age; low income; lack of time; low motivation; rural residency; perception of great effort needed for exercise; overweight or obesity; perception of poor health; and being disabled. Older adults may have additional factors that keep them from being physically active, including lack of social support, lack of transportation to facilities, fear of injury, and cost of programs.

Among children ages 4 to 12, the following factors have a positive association with physical activity: gender (boys); belief in ability to be active (self-efficacy); and parental support.

Among adolescents ages 13 to 18, the following factors have a positive association with physical activity: parental education; gender (boys); personal goals; physical education/school sports; belief in ability to be active (self-efficacy); and support of friends and family.

Environmental influences positively associated with physical activity among children and adolescents include:

- Presence of sidewalks
- Having a destination/walking to a particular place
- Access to public transportation
- Low traffic density
- Access to neighborhood or school play area and/or recreational equipment

People with disabilities may be less likely to participate in physical activity due to physical, emotional, and psychological barriers. Barriers may include the inaccessibility of facilities and the lack of staff trained in working with people with disabilities.

— Healthy People 2020 (www.healthypeople.gov)
Leisure-Time Physical Activity

A total of 26.6% of Seward County adults report no leisure-time physical activity in the past month.

No Leisure-Time Physical Activity in the Past Month

Healthy People 2020 = 32.6% or Lower

- 2017 PRC National Health Survey, PRC, Inc.

Notes:
- Asked of all respondents.

Activity Levels

Adults

**Recommended Levels of Physical Activity**

Adults should do 2 hours and 30 minutes a week of moderate-intensity (such as walking), or 1 hour and 15 minutes (75 minutes) a week of vigorous-intensity aerobic physical activity (such as jogging), or an equivalent combination of moderate- and vigorous-intensity aerobic physical activity. The guidelines also recommend that adults do muscle-strengthening activities, such as push-ups, sit-ups, or activities using resistance bands or weights. These activities should involve all major muscle groups and be done on two or more days per week.

The report finds that nationwide nearly 50 percent of adults are getting the recommended amounts of aerobic activity and about 30 percent are engaging in the recommended muscle-strengthening activity.

---

---

Learn more about CDC’s efforts to promote walking by visiting http://www.cdc.gov/vitalsigns/walking.
A total of 21.3% of Seward County adults regularly participate in adequate levels of both aerobic and strengthening activities (meeting physical activity recommendations).

- **DISPARITY**: Those less likely to meet the recommendations include adults age 60 and older and lower-income residents.

Children

**Recommended Levels of Physical Activity**

Children and adolescents should do 60 minutes (1 hour) or more of physical activity each day.

Among Seward County children age 2 to 17, 57.0% are reported to have had 60 minutes of physical activity on each of the seven days preceding the interview (1+ hours per day).

**Child Is Physically Active for One or More Hours per Day**

(Parents of Children Age 2-17)

- **Seward County**: 57.0%
- **US**: 50.5%

Sources:  
- US Census Bureau, County Business Patterns. Additional data analysis by CARES.

Notes:  
- Recreation and fitness facilities are defined by North American Industry Classification System (NAICS) Code 713940, which include establishments engaged in operating facilities which offer “exercise and other active physical fitness conditioning or recreational sports activities.” Examples include athletic clubs, gymnasiums, dance centers, tennis clubs, and swimming pools. This indicator is relevant because access to recreation and fitness facilities encourages physical activity and other healthy behaviors.
Weight Status

About Overweight & Obesity

Because weight is influenced by energy (calories) consumed and expended, interventions to improve weight can support changes in diet or physical activity. They can help change individuals’ knowledge and skills, reduce exposure to foods low in nutritional value and high in calories, or increase opportunities for physical activity. Interventions can help prevent unhealthy weight gain or facilitate weight loss among obese people. They can be delivered in multiple settings, including healthcare settings, worksites, or schools.

The social and physical factors affecting diet and physical activity (see Physical Activity topic area) may also have an impact on weight. Obesity is a problem throughout the population. However, among adults, the prevalence is highest for middle-aged people and for non-Hispanic black and Mexican American women. Among children and adolescents, the prevalence of obesity is highest among older and Mexican American children and non-Hispanic black girls. The association of income with obesity varies by age, gender, and race/ethnicity.

— Healthy People 2020 (www.healthypeople.gov)

Body Mass Index (BMI), which describes relative weight for height, is significantly correlated with total body fat content. The BMI should be used to assess overweight and obesity and to monitor changes in body weight. In addition, measurements of body weight alone can be used to determine efficacy of weight loss therapy. BMI is calculated as weight (kg)/height squared (m²). To estimate BMI using pounds and inches, use: [weight (pounds)/height squared (inches²)] x 703.

In this report, overweight is defined as a BMI of 25.0 to 29.9 kg/m² and obesity as a BMI ≥30 kg/m². The rationale behind these definitions is based on epidemiological data that show increases in mortality with BMIs above 25 kg/m². The increase in mortality, however, tends to be modest until a BMI of 30 kg/m² is reached. For persons with a BMI ≥30 kg/m², mortality rates from all causes, and especially from cardiovascular disease, are generally increased by 50 to 100 percent above that of persons with BMIs in the range of 20 to 25 kg/m².

Overweight Status

A total of 8 in 10 Seward County adults (80.0\%) are overweight.

- **BENCHMARK**: Worse than the statewide and national prevalence.

**Prevalence of Total Overweight (Overweight and Obese)**

Note: 50.0\% of overweight adults are trying to lose weight.

![Graph showing prevalence of total overweight (Overweight and Obese) with 80.0% for Seward County, 67.2% for KS, and 67.8% for US. Note: 50.0% of overweight adults are trying to lose weight.]

Sources:
- 2019 PRC Community Health Survey, PRC, Inc. [Items 155, 191]
- 2017 PRC National Health Survey, PRC, Inc.

Notes:
- Based on reported heights and weights, asked of all respondents.
- The definition of overweight is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 25.0, regardless of gender. The definition for obesity is a BMI greater than or equal to 30.0.

Note that 21.1\% of overweight adults have been given advice about their weight by a health professional in the past year (while over two-thirds have not).

The overweight prevalence above includes 48.3\% of Seward County adults who are obese.

- **BENCHMARK**: Much worse than the statewide and national prevalence.
- **DISPARITY**: Exceptionally high among Hispanic adults.

Top Concerns

Among those rating this issue as a “major problem,” reasons related to the following:

**Awareness/Education**
- Many residents are not educated on the adverse effects of poor nutrition, lack of exercise, and excessive weight. Others work many long hours and have many responsibilities and do not place nutrition, physical activity, and weight maintenance as a priority. - Community Leader
- Lack of education for immigrants. Lack of low-cost facilities. - Community Leader

**Nutrition**
- Policies and environment that is not optimally supportive of healthy nutrition, physical activity, or healthy weight. - Community Leader
- Kansas Health Matters reported that at one point, people in Seward are eating less than one cup in vegetables and/or fruit per day. Walking trails in low-income neighborhoods have also been a challenge. In Seward, there is also a great issue regarding language barriers. Language barriers have caused difficulty in accessing needs. In Seward, we are limited to six to eight food pantries with only one to two having an interpreter readily available. - Public Health Representative

**Obesity**
- Looking at kids in the school, and many adults in our community, it seems that many are overweight. - Public Health Representative
- Walk down the hall of any school or business in our community and you will see obese children and adults. We do not have a climate that encourages a healthy living style. - Community Leader

**Affordable Care/Services**
- Cost and accessibility. - Social Services Provider

**Prevalence/Incidence**
- This is so bad of a problem and nothing is done in this community; if there is, it costs a fortune. - Community Leader
Contributing Factors

Food accessibility is a major concern in Seward. Kismet, which is 20 miles from Liberal, is currently in a food desert. There is limited accessibility to food within walking and driving distance since their local grocery/convenience store closed. This, too, could be the case for Liberal residents. Culturally appropriate foods are difficult to find within walking distance for most residents, especially minorities. Transportation creates an issue, making it difficult to access healthy foods. Many people will purchase foods at a convenience store at a higher price and higher fat content. - Public Health Representative
Substance Abuse

About Substance Abuse

Substance abuse has a major impact on individuals, families, and communities. The effects of substance abuse are cumulative, significantly contributing to costly social, physical, mental, and public health problems. These problems include:

- Teenage pregnancy
- Human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS)
- Other sexually transmitted diseases (STDs)
- Domestic violence
- Child abuse
- Motor vehicle crashes
- Physical fights
- Crime
- Homicide
- Suicide

Substance abuse refers to a set of related conditions associated with the consumption of mind- and behavior-altering substances that have negative behavioral and health outcomes. Social attitudes and political and legal responses to the consumption of alcohol and illicit drugs make substance abuse one of the most complex public health issues. In addition to the considerable health implications, substance abuse has been a flash-point in the criminal justice system and a major focal point in discussions about social values: people argue over whether substance abuse is a disease with genetic and biological foundations or a matter of personal choice.

Advances in research have led to the development of evidence-based strategies to effectively address substance abuse. Improvements in brain-imaging technologies and the development of medications that assist in treatment have gradually shifted the research community’s perspective on substance abuse. There is now a deeper understanding of substance abuse as a disorder that develops in adolescence and, for some individuals, will develop into a chronic illness that will require lifelong monitoring and care.

Improved evaluation of community-level prevention has enhanced researchers’ understanding of environmental and social factors that contribute to the initiation and abuse of alcohol and illicit drugs, leading to a more sophisticated understanding of how to implement evidence-based strategies in specific social and cultural settings.

A stronger emphasis on evaluation has expanded evidence-based practices for drug and alcohol treatment. Improvements have focused on the development of better clinical interventions through research and increasing the skills and qualifications of treatment providers.

— Healthy People 2020 (www.healthypeople.gov)
Alcohol Use

Excessive Drinking

A total of 24.7% of area adults are excessive drinkers (heavy and/or binge drinkers).

- **DISPARITY**: Significantly higher among men, adults younger than 40, mid- to high-income residents, and Hispanic adults.

### Excessive Drinkers

(Seward County, 2019)

Healthy People 2020 = 25.4% or Lower

2017 PRC National Health Survey, PRC, Inc.

Notes: Asked of all respondents.

Illicit Drug Use
A total of 0.5% of Seward County adults acknowledge using an illicit drug in the past month.

- **BENCHMARK**: More favorable than the national figure. Satisfies the HP2020 objective.

Illicit Drug Use in the Past Month
(Seward County, 2019)
Healthy People 2020 = 7.1% or Lower

For the purposes of this survey, “illicit drug use” includes use of illegal substances or of prescription drugs taken without a physician’s order.

Note: As a self-reported measure – and because this indicator reflects potentially illegal behavior – it is reasonable to expect that it might be underreported, and that actual illicit drug use in the community is likely higher.
Alcohol & Drug Treatment
A total of 4.7% of Seward County adults report that they have sought professional help for an alcohol or drug problem at some point in their lives.

### Have Ever Sought Professional Help for an Alcohol/Drug-Related Problem

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Access to Care/Services
- There are no known treatment centers available. People must seek out of area care when treatment is desired. - Community Leader
- The only substance abuse treatment in our community is City on the Hill. This is a very small treatment program. Access for individuals who are unable to pay for these services have nowhere to turn. - Social Services Provider
- Lack of facilities, clinicians, support groups. - Community Leader
- Limitations to resources. There is one well-known facility that assists with substance abuse/drug addiction, but not many other options. - Public Health Representative
- No resources. City on the Hill is a joke. - Community Leader
- Currently, there is only one place in the community, and it is geared towards women and it is very expensive, and some people don’t want to go to a group facility. - Social Services Provider

Denial/Stigma
- We seem to have a society that has turned a blind eye and deaf ear to the harm of substance abuse. The changing laws and attitudes to drug use are also having a negative effect on society. - Community Leader
- Community denial. Substance abuse is swept under the rug at multiple levels. Not reported by law enforcement and not reported by media. - Community Leader
- Identifying those in need and getting them to seek treatment. - Community Leader

Affordable Care/Services
- Financial, and not many substance abuse centers that are effective. - Social Services Provider
- Cost-effective treatment and evidence-based providers. - Community Leader

Funding
- Lack of funding for individuals without coverage for such services. - Social Services Provider
- Funding and programs. - Community Leader
Contributing Factors

Our community seems to have a significant increase in the numbers of people with substance abuse issues. It seems to be fairly easy to access, and there are limited resources to help with addiction. - Community Leader

Laws. - Other Health Provider

Drug usage. - Community Leader

Opioid abuse and doctors that continue to prescribe it just so they get a good score on a survey. - Community Leader

Prevalence/Incidence

Substance abuse is a huge problem in our community, not just the trafficking, but the use in our community. - Community Leader

Most Problematic Substances

Key informants (who rated this as a “major problem”) identified alcohol as the most problematic substance abused in the community, followed by methamphetamine/other amphetamines and marijuana.

Tobacco Use

About Tobacco Use

Tobacco use is the single most preventable cause of death and disease in the United States. Scientific knowledge about the health effects of tobacco use has increased greatly since the first Surgeon General’s report on tobacco was released in 1964.

Tobacco use causes:

- Cancer
- Heart disease
- Lung diseases (including emphysema, bronchitis, and chronic airway obstruction)
- Premature birth, low birth weight, stillbirth, and infant death

There is no risk-free level of exposure to secondhand smoke. Secondhand smoke causes heart disease and lung cancer in adults and a number of health problems in infants and children, including: severe asthma attacks; respiratory infections; ear infections; and sudden infant death syndrome (SIDS).

Smokeless tobacco causes a number of serious oral health problems, including cancer of the mouth and gums, periodontitis, and tooth loss. Cigar use causes cancer of the larynx, mouth, esophagus, and lung.

— Healthy People 2020 (www.healthypeople.gov)

Cigarette Smoking

Cigarette Smoking Prevalence

A total of 15.3% of Seward County adults currently smoke cigarettes, either regularly (every day) or occasionally (on some days).

Cigarette Smoking Prevalence
(Seward County, 2019)

Sources: 2019 PRC Community Health Survey, PRC, Inc. [Item 159]
Notes: Asked of all respondents.
Note the following findings related to cigarette smoking prevalence in Seward County.

- **DISPARITY**: Men are more likely than women to smoke. In addition, adults age 60 and older are significantly more likely than adults ages 40 to 59 to smoke.

### Current Smokers

**Healthy People 2020 = 12.0% or Lower**

“Smokes at home” refers to someone smoking cigarettes, cigars, or a pipe in the home an average of four or more times per week in the past month.

Smoking Cessation

About Reducing Tobacco Use

Preventing tobacco use and helping tobacco users quit can improve the health and quality of life for Americans of all ages. People who stop smoking greatly reduce their risk of disease and premature death. Benefits are greater for people who stop at earlier ages, but quitting tobacco use is beneficial at any age.

Many factors influence tobacco use, disease, and mortality. Risk factors include race/ethnicity, age, education, and socioeconomic status. Significant disparities in tobacco use exist geographically; such disparities typically result from differences among states in smoke-free protections, tobacco prices, and program funding for tobacco prevention.

— Healthy People 2020 (www.healthypeople.gov)
Other Tobacco Use

Use of Vaping Products
Most Seward County adults have never tried electronic cigarettes (e-cigarettes) or other electronic vaping products.

Use of Vaping Products
(Seward County, 2019)

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

E-Cigarettes
The use of vape pens have increased among youth. - Public Health Representative
Placed tobacco use as a major problem in the community, and I don’t believe it is anymore. Now vaping is replacing smoking as an activity. - Social Services Provider
Prevalence/Incidence

- Its use seems to be rather common. - Community Leader
- I continue to see people standing outside of businesses in our community to smoke. I also see high school and college students smoking throughout our community. - Community Leader

Contributing Factors

- No resources. - Community Leader
- Easy access by teens. - Community Leader
- Many young people are using tobacco products. - Community Leader
Sexual Health

HIV

About Human Immunodeficiency Virus (HIV)

The HIV epidemic in the United States continues to be a major public health crisis. An estimated 1.1 million Americans are living with HIV, and 1 in 5 people with HIV do not know they have it. HIV continues to spread, leading to about 56,000 new HIV infections each year.

HIV is a preventable disease, and effective HIV prevention interventions have been proven to reduce HIV transmission. People who get tested for HIV and learn that they are infected can make significant behavior changes to improve their health and reduce the risk of transmitting HIV to their sex or drug-using partners. More than 50% of new HIV infections occur as a result of the 21% of people who have HIV but do not know it.

In the era of increasingly effective treatments for HIV, people with HIV are living longer, healthier, and more productive lives. Deaths from HIV infection have greatly declined in the United States since the 1990s. As the number of people living with HIV grows, it will be more important than ever to increase national HIV prevention and healthcare programs.

There are gender, race, and ethnicity disparities in new HIV infections:

- Nearly 75% of new HIV infections occur in men.
- More than half occur in gay and bisexual men, regardless of race or ethnicity.
- 45% of new HIV infections occur in African Americans, 35% in whites, and 17% in Hispanics.

Improving access to quality healthcare for populations disproportionately affected by HIV, such as persons of color and gay and bisexual men, is a fundamental public health strategy for HIV prevention. People getting care for HIV can receive:

- Antiretroviral therapy
- Screening and treatment for other diseases (such as sexually transmitted infections)
- HIV prevention interventions
- Mental health services
- Other health services

As the number of people living with HIV increases and more people become aware of their HIV status, prevention strategies that are targeted specifically for HIV-infected people are becoming more important. Prevention work with people living with HIV focuses on:

- Linking to and staying in treatment.
- Increasing the availability of ongoing HIV prevention interventions.
- Providing prevention services for their partners.

Public perception in the US about the seriousness of the HIV epidemic has declined in recent years. There is evidence that risky behaviors may be increasing among uninfected people, especially gay and bisexual men. Ongoing media and social campaigns for the general public and HIV prevention interventions for uninfected persons who engage in risky behaviors are critical.

— Healthy People 2020 (www.healthypeople.gov)
HIV Prevalence
In 2015, there was a prevalence of 124.9 HIV cases per 100,000 population in Seward County.

- **BENCHMARK**: Much lower than the national prevalence.

**Top Concerns**
Among those rating this issue as a “major problem,” reasons related to the following:

**Awareness/Education**
*There is no information publicized about care, treatment, or prevention.* - Community Leader
Denial/Stigma

People are afraid to look for services, and they don't feel comfortable going to the health department. They think it will get out that they have it. - Social Services Provider

Sexually Transmitted Diseases

About Sexually Transmitted Diseases

STDs refer to more than 25 infectious organisms that are transmitted primarily through sexual activity. Despite their burdens, costs, and complications, and the fact that they are largely preventable, STDs remain a significant public health problem in the United States. This problem is largely unrecognized by the public, policymakers, and health care professionals. STDs cause many harmful, often irreversible, and costly clinical complications, such as: reproductive health problems; fetal and perinatal health problems; cancer; and facilitation of the sexual transmission of HIV infection.

Because many cases of STDs go undiagnosed—and some common viral infections, such as human papillomavirus (HPV) and genital herpes, are not reported to CDC at all—the reported cases of chlamydia, gonorrhea, and syphilis represent only a fraction of the true burden of STDs in the US. Untreated STDs can lead to serious long-term health consequences, especially for adolescent girls and young women. Several factors contribute to the spread of STDs.

Biological Factors. STDs are acquired during unprotected sex with an infected partner. Biological factors that affect the spread of STDs include:

- **Asymptomatic nature of STDs.** The majority of STDs either do not produce any symptoms or signs, or they produce symptoms so mild that they are unnoticed; consequently, many infected persons do not know that they need medical care.
- **Gender disparities.** Women suffer more frequent and more serious STD complications than men do. Among the most serious STD complications are pelvic inflammatory disease, ectopic pregnancy (pregnancy outside of the uterus), infertility, and chronic pelvic pain.
- **Age disparities.** Compared to older adults, sexually active adolescents ages 15 to 19 and young adults ages 20 to 24 are at higher risk for getting STDs.
- **Lag time between infection and complications.** Often, a long interval, sometimes years, occurs between acquiring an STD and recognizing a clinically significant health problem.

Social, Economic, and Behavioral Factors. The spread of STDs is directly affected by social, economic, and behavioral factors. Such factors may cause serious obstacles to STD prevention due to their influence on social and sexual networks, access to and provision of care, willingness to seek care, and social norms regarding sex and sexuality. Among certain vulnerable populations, historical experience with segregation and discrimination exacerbates these factors. Social, economic, and behavioral factors that affect the spread of STDs include: racial and ethnic disparities; poverty and marginalization; access to healthcare; substance abuse; sexuality and secrecy (stigma and discomfort discussing sex); and sexual networks (persons “linked” by sequential or concurrent sexual partners).

— Healthy People 2020 (www.healthypeople.gov)

Chlamydia & Gonorrhea

In 2016, the chlamydia incidence rate in Seward County was 514.0 cases per 100,000 population.

The Seward County gonorrhea incidence rate in 2016 was 34.6 cases per 100,000 population.
**BENCHMARK:** Chlamydia incidence is significantly higher than the statewide rate. Gonorrhea incidence is significantly lower than the state and national rates.

Among those rating this issue as a “major problem,” reasons related to the following:

**Awareness/Education**

- No sex education for preventative. - Social Services Provider  
- Lack of education from educators, parents, faith homes. Casual sex among teens and adults, hooking up. The influence of drugs and/or alcohol. - Social Services Provider
Access to Care/Services

Once again, no resources. - Community Leader
Access to Health Services
Health Insurance Coverage

Type of Healthcare Coverage

A total of 58.1% of Seward County adults age 18 to 64 report having healthcare coverage through private insurance. Another 20.6% report coverage through a government-sponsored program (e.g., Medicaid, Medicare, military benefits).

Here, lack of health insurance coverage reflects respondents age 18 to 64 (thus, excluding the Medicare population) who have no type of insurance coverage for healthcare services – neither private insurance nor government-sponsored plans (e.g., Medicaid).

Lack of Health Insurance Coverage

Among adults age 18 to 64, 21.3% report having no insurance coverage for healthcare expenses.

- **BENCHMARK**: Less favorable than the national finding. The Healthy People 2020 objective is universal coverage.
- **DISPARITY**: Lower-income residents and Hispanic residents are most likely to report being without coverage.
Lack of Healthcare Insurance Coverage
(Adults Age 18-64)

Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Difficulties Accessing Healthcare

About Access to Healthcare

Access to comprehensive, quality health care services is important for the achievement of health equity and for increasing the quality of a healthy life for everyone. It impacts: overall physical, social, and mental health status; prevention of disease and disability; detection and treatment of health conditions; quality of life; preventable death; and life expectancy.

Access to health services means the timely use of personal health services to achieve the best health outcomes. It requires three distinct steps: 1) Gaining entry into the health care system; 2) Accessing a health care location where needed services are provided; and 3) Finding a health care provider with whom the patient can communicate and trust.

— Healthy People 2020 (www.healthypeople.gov)

Difficulties Accessing Services

A total of 42.0% of Seward County adults report some type of difficulty or delay in obtaining healthcare services in the past year.

- **DISPARITY:** Higher among lower-income residents and among those ages 40 to 59.

Experienced Difficulties or Delays of Some Kind in Receiving Needed Healthcare in the Past Year
(Seward County, 2019)

![Bar chart showing experienced difficulties or delays in receiving needed healthcare by gender, age group, income level, race, and Seward County versus nationwide.]

**Sources:**
- 2019 PRC Community Health Survey, PRC, Inc. [Item 171]

**Notes:**
- Asked of all respondents.
- Percentage represents the proportion of respondents experiencing one or more barriers to accessing healthcare in the past 12 months.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Barriers to Healthcare Access
Of the tested barriers, prescription costs and inconvenient office hours impacted the greatest shares of Seward County adults.

- **BENCHMARK**: While one barrier was significantly lower than the US finding (getting an appointment to see a doctor), another was significantly higher (unable to see a doctor due to language or cultural differences).

### Barriers to Access Have Prevented Medical Care in the Past Year

Key Informant Input: Access to Healthcare Services
Key informants taking part in an online survey most often characterized Access to Healthcare Services as a “moderate problem” in the community.

Perceptions of Access to Healthcare Services as a Problem in the Community
(Key Informants, 2019)

Top Concerns
Among those rating this issue as a “major problem,” reasons related to the following:

Affordable Care/Services
Financial restrictions. - Social Services Provider
Unaffordable and lack of insurance. - Community Leader
A majority of the people can't afford it because they don't have insurance or are illegal. - Social Services Provider
So many of our residents do not have the monetary means to seek proper medical care. Additionally, many residents who are not legal citizens are often afraid to seek assistance due to their status. Finally, mental health challenges are continually on the rise, and many people, whether they have the monetary means or not, do not tend to see how essential it is to address those challenges. - Community Leader
Lack of Providers
- Too few providers, as well as lack of specialty services. - Social Services Provider
- Variety of doctors in specialized fields. - Community Leader
- Not enough family doctors, not enough options when needing an obstetrician. - Public Health Representative
- Access to family doctors and doctors to follow care. - Other Health Provider
- Lack of qualified health care providers for general health care, both adult and children. - Community Leader
- General family doctor. There are a lot of PAs, but few MD or DO, and they are very hard to get in to see in a timely manner. - Public Health Representative

Access to Care/Services
We are limited to the resources we have available to community members. We also have a large population of undocumented immigrants, which leads to scarce resources due to location and fear of accessing services. - Public Health Representative

Transportation
Transportation problems with some patients. - Physician

Type of Care Most Difficult to Access
Key informants (who rated this as a “major problem”) most often identified dental care, substance abuse treatment, and behavioral health as the most difficult to access in the community.

Primary Care Services

About Primary Care

Improving health care services depends in part on ensuring that people have a usual and ongoing source of care. People with a usual source of care have better health outcomes and fewer disparities and costs. Having a primary care provider (PCP) as the usual source of care is especially important. PCPs can develop meaningful and sustained relationships with patients and provide integrated services while practicing in the context of family and community. Having a usual PCP is associated with:

- Greater patient trust in the provider
- Good patient-provider communication
- Increased likelihood that patients will receive appropriate care

Improving health care services includes increasing access to and use of evidence-based preventive services. Clinical preventive services are services that: prevent illness by detecting early warning signs or symptoms before they develop into a disease (primary prevention); or detect a disease at an earlier, and often more treatable, stage (secondary prevention).

— Healthy People 2020 (www.healthypeople.gov)

Access to Primary Care

In 2014, there were 11 primary care physicians in Seward County, translating to a rate of 46.9 primary care physicians per 100,000 population.

- **BENCHMARK:** Less favorable than state and national ratios.

Notes:
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Oral Health

About Oral Health

Oral health is essential to overall health. Good oral health improves a person’s ability to speak, smile, smell, taste, touch, chew, swallow, and make facial expressions to show feelings and emotions. However, oral diseases, from cavities to oral cancer, cause pain and disability for many Americans. Good self-care, such as brushing with fluoride toothpaste, daily flossing, and professional treatment, is key to good oral health. Health behaviors that can lead to poor oral health include: tobacco use; excessive alcohol use; and poor dietary choices.

The significant improvement in the oral health of Americans over the past 50 years is a public health success story. Most of the gains are a result of effective prevention and treatment efforts. One major success is community water fluoridation, which now benefits about 7 out of 10 Americans who get water through public water systems. However, some Americans do not have access to preventive programs. People who have the least access to preventive services and dental treatment have greater rates of oral diseases. A person’s ability to access oral healthcare is associated with factors such as education level, income, race, and ethnicity.

Barriers that can limit a person’s use of preventive interventions and treatments include: limited access to and availability of dental services; lack of awareness of the need for care; cost; and fear of dental procedures.

There are also social determinants that affect oral health. In general, people with lower levels of education and income, and people from specific racial/ethnic groups, have higher rates of disease. People with disabilities and other health conditions, like diabetes, are more likely to have poor oral health.

Potential strategies to address these issues include:

- Implementing and evaluating activities that have an impact on health behavior.
- Promoting interventions to reduce tooth decay, such as dental sealants and fluoride use.
- Evaluating and improving methods of monitoring oral diseases and conditions.
- Increasing the capacity of State dental health programs to provide preventive oral health services.
- Increasing the number of community health centers with an oral health component.

Dental Insurance

Almost two-thirds of Seward County adults (64.5%) have dental insurance that covers all or part of their dental care costs.
Dental Care

Adults

A total of 52.6% of Seward County adults have visited a dentist or dental clinic (for any reason) in the past year.

- **BENCHMARK**: Significantly lower than the statewide finding.
- **DISPARITY**: Much lower among lower-income adults and those without dental insurance.

**Notes:** Asked of all respondents.

### Top Concerns

Among those rating this issue as a "major problem," reasons related to the following:
Lack of Providers

Woeful lack of dental health care providers. - Community Leader
There are limited local dentists. NONE of them accept patients with Medicaid insurance, and none will accept patients without cash payment at time of services. In our community, there are MANY children with severe dental cares causing daily pain, which interferes with daily life, education. Some are referred to Garden City, but transportation and payment ability is a significant problem. - Community Leader
There are only three dentists in town. - Community Leader
There is no surgical dentistry at all. - Community Leader

Medicare/Medicaid

Dentists do not take Medicaid. Patients use the emergency room regarding dental problems. - Social Services Provider
Few locations accept Medicaid and/or work with low-income families. With limited options, many families struggle to find a provider that fits their needs. Some families will even decide to not seek help due to the difficulty in finding one. Transportation can also be an issue. - Public Health Representative
Lack of dental care facilities that take medical aid patients. I hear we have a new clinic coming. - Community Leader

Affordable Care/Services

Not affordable, and many don’t have insurance. - Social Services Provider
Vision Care

A total of 61.0% of Seward County residents had an eye exam in the past two years during which their pupils were dilated.

- **DISPARITY**: Much lower among Hispanic adults and those younger than 60 (note the positive correlation with age).

Local Resources
Perceptions of Local Healthcare Services

More than one-third of Seward County adults rate the overall healthcare services available in their community as “excellent” or “very good.”

Rating of Overall Healthcare Services Available in the Community
(Seward County, 2019)

- Excellent 9.4%
- Very Good 27.9%
- Good 45.9%
- Fair 14.0%
- Poor 2.9%

However, 16.9% of residents characterize local healthcare services as “fair” or “poor.”

- DISPARITY: “Fair” and “poor” ratings are higher among adults over age 40, and among those reporting difficulties accessing healthcare services.

Perceive Local Healthcare Services as “Fair/Poor”
(Seward County, 2019)
Resources Available to Address the Significant Health Needs

The following represent potential measures and resources (such as programs, organizations, and facilities in the community) identified by key informants as available to address the significant health needs identified in this report. This list only reflects input from participants in the Online Key Informant Survey and should not be considered to be exhaustive nor an all-inclusive list of available resources.

Evaluation of Past Activities

SWMC’s previous Implementation Strategy outlined a plan for addressing the following priorities identified in the 2016 CHNA:

1. Maternal and child health
2. Healthcare access availability
3. Chronic health conditions, including heart disease, diabetes, and obesity
4. Mental health
5. Sexual assault
6. Sexually transmitted infections

The below list describes plan activities completed by SWMC.

- Continue free or low-cost community screenings for cardiovascular disease and other heart-related conditions. These screenings are on a continual basis at community events, educational events, and the annual health fair sponsored by the hospital.
- Continued support and marketing of the Dining for Diabetes program among community members diagnosed with diabetes. This series includes cooking demos and diabetes education.
- Increased number of physicians and allied health professionals offering services. SWMC has since recruited six new hospitalist physician assistants to the hospitalist program, one family practice physician, one radiologist, one orthopedic surgeon, one OB/GYN, one nurse practitioner-certified Nurse Midwife, one general surgeon, one anesthesiologist, one CRNA, and one ENT. SWMC is still currently recruiting a family medicine physician, internal medicine physician, nurse practitioner, general surgeon, two pediatricians, and a CRNA. Other service expansions include: VA clinic; Guymon, Oklahoma Women’s Care Center; Guymon, Oklahoma McMurry Family Care Center; and an ENT Care Center.
- Increased the amount of targeted marketing at the annual health fair, community screening events, care centers, and educational events. SWMC provided financial support to the school’s and community’s recreation and athletics programs. Beyond this, SWMC continues to provide smoking cessation activities, education on hand hygiene, and blood sugar tests for children.
Recommendations & Implementation Plan FY 2020-2022

The CHNA conducted in 2019 identified significant health needs within Seward County and the Southwest Medical Center community. SWMC’s Implementation Plan outlines and addresses the following priorities identified in the 2019 CHNA:

1. Access to Healthcare Services
2. Chronic Conditions: Diabetes, Cancer, Heart Disease, and Obesity
3. Sexual Health
4. Mental Health and Substance Abuse
5. Injury and Violence

Various community and stakeholder surveys were organized to provide an objective method of reviewing and prioritizing service area health needs. The survey groups were asked to reflect on the size and seriousness of any health needs they cited and also provide current community health strengths. The surveyed groups identified and ranked top community health needs.

The priority-setting process involved the input of a diverse group with knowledge and/or expertise in public health as well as persons who represent the broad interest of the community served by the Hospital. Key stakeholders included representatives from: Seward County Public Health, Seward County Community College, USD 480, Seward County EMS, Medical and Dental Providers, Area Agency on Aging, and City and County Commissioners. The CHNA was coordinated and produced by Professional Research Consultants from Omaha, NE.

Southwest Medical Center is dedicated to continually learning, engaging and fulfilling the health needs of the community we serve. A description of the actions to be taken by Southwest Medical Center to address the significant health needs identified through the most recently conducted CHNA and approved by the Southwest Medical Center Board of Trustees regular meeting are identified in the report table CHNA Implementation Plan Tactics-SWMC (Starting 01/01/20 to 12/31/22).

Utilize CDC program information Vital Signs: Preventing 1 Million Heart Attacks and Strokes program information to assist in program development and communications. Heart disease and stroke are preventable, yet they remain leading causes of death, disability, and healthcare spending in the United States. Alarmingly, in 2016, more than 800,000 of these life-changing cardiovascular events happened to adults ages 35–64. The new CDC Vital Signs highlights how Million Hearts® is focusing national efforts on preventing 1 million heart attacks and strokes by 2022.</td>

<tr>
<td><strong>a</strong></td>
<td>Increase awareness of Prevention Strategies. Sexual violence is a serious problem that can have lasting, harmful effects on victims and their family, friends, and communities. The goal of sexual violence prevention is to stop it from happening in the first place. The solutions are just as complex as the problem. Preventing sexual violence requires addressing factors at all levels of the social ecology—the individual, relational, community, and societal levels. Program information is available at: <a href="https://www.cdc.gov/violenceprevention/sexualviolence/prevention.html">https://www.cdc.gov/violenceprevention/sexualviolence/prevention.html</a></td>
